## Abstract

A survey of documentation for L<sup>A</sup>T<sub>E</sub>X. Included are references to printed and electronic books and manuals, symbol lists, FAQs, the L<sup>A</sup>T<sub>E</sub>X source code, CTAN and distributions, programming-related packages, users groups and online communities, and information on creating packages and documentation.

## Introduction

Reinventing the wheel may be useful if you think that you can do it better. Worse, though, is not even being aware that the wheel has already been invented in the first place, which can be an embarrassing waste of time. Such can be the case both for a new L<sup>A</sup>T<sub>E</sub>X programmer who isn't aware of the many ways things may be done, but also for someone, this author included, who learned L<sup>A</sup>T<sub>E</sub>X many years ago but may have missed some of the recent advancements in package code and documentation.

A wealth of information is available, not only in print and online, but also directly embedded in the typical L<sup>A</sup>T<sub>E</sub>X distribution. The following is meant to be a broad overview of some of today's resources for L<sup>A</sup>T<sub>E</sub>X programmers.

In some cases the same document may be listed in several categories. For example, a graphics FAQ also available in French may be listed under graphics, FAQs, and also French documents.

Many older documents are not included.

(The latest version of this document is available as the L<sup>A</sup>T<sub>E</sub>X `docsurvey` package.)

## Printed books

Even in an electronic/online era, printed books still have the advantage of being able to be opened for reference without taking up space on the screen. Printed books also provide extended discussion of useful topics, have extensive human-edited indexes which are more useful than a simple document-wide search function, and some are also available in electronic format.

## Accessing embedded information

### **texdoc** and **mthelp**

A large amount of documentation is included in a T<sub>E</sub>X distribution. For TeXLive distributions, package documentation can be accessed with the **texdoc** program. Enter “**texdoc -l <name>**” to search for matching package, file, or program names. In some cases the same document is available in both letter or A4 paper sizes, or in several languages. **texdoc** is also available online, with popular packages sorted by category. (<http://www.texdoc.net/>)

For MikT<sub>E</sub>X, the **mthelp** program accesses package documentation. Enter “**mthelp <name>**”.

### **kpsewhich**

The program **kpsewhich** may be used to find out where a file is located. **kpsewhich filename** searches for and returns the path to the given filename.

**kpsewhich** can also return directories, such as:

```
kpsewhich -var-value TEXMFROOT
kpsewhich -var-value TEXMFDIST
kpsewhich -var-value TEXMFLOCAL
```

Some package authors choose not to include the source code in the package documentation. To view the source code:

1. To locate and read a package’s .sty file:

```
kpsewhich package.sty
```

Usually these files have their comments removed, so it is better to use the .dtx file instead.

2. The .dtx file is usually available, and will have the package’s source code.

```
kpsewhich package.dtx
```

If it is not installed on your local system, it will be necessary to download the .dtx file from CTAN (see the next section).

The comments are not yet typeset and so will not be as easily read.

3. To typeset the documentation with the source code, copy the .dtx file and any associated image files somewhere local and then look for \OnlyDescription in the source. This command tells the **ltxdoc** package not to print the source code.

4. Remove \OnlyDescription, then process the .dtx file with

```
pdflatex package.dtx
```

Barring unusual circumstances, this will create a new documentation .pdf file with the package source code included.

Documents only the most commonly-used actions and options for tlmgr. (`texdoc tlmgrbasics`).

## Obtaining packages – Comprehensive TeX Archive Network (CTAN)

TeXLive installations use the tlmgr program to obtain packages. MikTeX installations automatically install packages as needed. Where TeX is installed by an operating-system package manager, that manager should be used to install additional packages.

For custom installations, it may be necessary to manually install packages downloaded from the Comprehensive TeX Archive Network (CTAN), which provides a master collection of packages. A search function is available, which is useful when you know the name of a package or its author, and a list of topics is also provided. There are so many topics, however, that finding the right topic can be a problem in itself. One useful method to find what you are looking for is to search for a related package you may already know about, then look at its description on CTAN to see what topics are shown for it. Selecting these topics then shows you related packages. (<https://ctan.org/>)

## Automatic compiling

The programs `arara` and `latexmk` automatically recompile as necessary to resolve all dependencies.

## Converting to HTML and other document formats

**Using TeX to generate the HTML:**

The `l warp` package and the `tex4ht` program each use native LATEX to interpret the document and generate HTML. More of LATEX is supported compared to the translators listed below.

**`l warp` package:**

Supports hundreds of packages. Generates HTML, and provides indirect assistance for EPUB conversion and copy/paste into a word-processor. <https://ctan.org/pkg/l warp>

**`tex4ht` program:**

Generates HTML, EPUB, ODT, and Docbook. <http://tug.org/tex4ht/>

**Translators:**

These systems use external programs to translate a subset of LATEX syntax into HTML. Search for each on CTAN (<http://ctan.org>).

## Programming L<sup>A</sup>T<sub>E</sub>X

A number of packages are especially useful for L<sup>A</sup>T<sub>E</sub>X programmers: (texdoc <packagename>)

**xifthen:** Conditionals.

**xstring:** String manipulation.

**etoolbox:** A wide range of programming tools, often avoiding the need to resort to low-level TEX.

**keyval, xkeyval, kvsetkeys, ltxkeys:** Key/value arguments.

**etextools:** Adds to etoolbox. Strings, lists, and more.

**pgfkeys, pgfkeyx:** Another form of key/value arguments.

**xparse:** Define macros and environments with flexible argument types.

**kvoptions:** Key/value package options.

**environ:** Process environment contents.

**expl3:** L<sup>A</sup>T<sub>E</sub>X3 programming.

**arrayjobx, fifo-stack, forarray, forloop, xfor:** Programming arrays, stacks, and loops.

**l3keys, l3keys2e:** Key/value for L<sup>A</sup>T<sub>E</sub>X3.

**iftex:** Detect T<sub>E</sub>X engine.

**chktex:** Locates typographic errors.

**ifplatform:** Detect operating system.

**CTAN topic macro-supp:** An entire topic of useful programming macros.
