

achemso — Support for submissions to American Chemical Society journals*

Joseph Wright[†]

Released 2025-04-11

Abstract

The achemso bundle provides a L^AT_EX class file and B_IB_TE_X style file in accordance with the requirements of the American Chemical Society (ACS). The files can be used for any documents, but have been carefully designed and tested to be suitable for submission to ACS journals.

The bundle also includes the natmove package. This package is loaded by achemso, and provides automatic moving of superscript citations after punctuation.

1 Introduction

Support for B_IB_TE_X bibliography following the requirements of the American Chemical Society (ACS), along with a package to make these easy to have been

*This file describes version v3.13j, last revised 2025-04-11.

[†]E-mail: joseph.wright@morningstar2.co.uk

available since version one of `achemso`. The re-write from version 1 to version 2 made a number of improvements to the package, and also added a number of new features. However, neither version one nor version two of the package was targeted directly at use for submissions to ACS journals. This new release of `achemso` addresses this issue.

The bundle consists of four parts. The first is a $\text{\LaTeX} 2\epsilon$ class, intended for use in submissions. It is based on the standard `article` class, but makes various changes to facilitate ease of use. The second part is the \LaTeX package. The package contains the parts of the bundle which are appropriate for use with other document classes.¹ Thirdly, two \BIBTeX style files are included. These are used by both the class and the package, but can be used directly if desired. Finally, an example document is included; this is intended to act a potential template for submission, and illustrates the use of the class file.

2 Installation

The package is supplied in `dtx` format and as a pre-extracted zip file, `achemso.tds.zip`. The later is most convenient for most users: simply unzip this in your local `texmf` directory and run `texhash` to update the database of file locations. If you want to unpack the `dtx` yourself, running `tex achemso.dtx` will extract the package whereas `latex achemso.dtx` will extract it and also typeset the documentation.

Typesetting the documentation requires a number of packages in addition to those needed to use the package. This is mainly because of the number of demonstration items included in the text. To compile the documentation without error, you will need the packages:

- `array`
- `booktabs`
- `hypdoc`
- `listings`
- `lmodern`
- `mathpazo`
- `microtype`

3 Requirements

The `achemso` class requires the following packages:

- `caption`
- `float`
- `geometry`

¹For example, when writing a thesis.

- natbib
- setspace
- xkeyval

These are normally present in the current major TeX distributions, but are also available from [The Comprehensive TeX Archive Network](#).

4 The class file

The class file has been designed for use in submitting journals to the ACS. It uses all of the modifications described here (those in the package as well as those in the class). The accompanying example manuscript can be used as a template for the correct use of the class file. It is intended to act as a model for submission.

When submitting communications to *J. Am. Chem. Soc.*, the class will automatically lay the document out in the publication style. This allows the author to judge the length of text submitted more accurately. Changing the `manuscript` in the demonstration document to `communication` will illustrate the effect.

4.1 Class options

`journal` (*env.*) The class supports a limited number of options, which are specifically-targeted at submission. The class uses the `keyval` system for options, in the form `key=value`. The most important option is `journal`. This is an identifier for the target journal: from <https://pubs.acs.org/>, the identifier is the part of the URL after `https://pubs.acs.org/journal/`, e.g. for *J. Org. Chem.* it would be `joceah`. If an unknown journal is specified, the package will fall-back on the `journal=jacsat` option.

`manuscript` (*env.*) The second option is the `manuscript` option. This specifies the type of paper in the manuscript. The values here are `article`, `note`, `communication`, `review`, `letter` and `perspective`. The valid values will depend on the value of `journal`. The `manuscript` option determines whether sections and an abstract are valid. The value `suppinfo` is also available for supporting information.

`layout` (*env.*) The `achemso` class can produce drafts in two layout styles. The standard setting for the `layout` option is `traditional`, which produces a double-spaced single column manuscript. The alternative setting `twocolumn` will use single spacing and print the text in two columns. The second option is obviously more compact. If the journal requires a particular style this option may be ignored.

`email` (*env.*) It may be desirable to omit e-mail addresses from the front page of a manuscript. The printing of e-mail addresses can be disabled using the `email` option, which takes Boolean values only. The default is to print e-mail addresses. Notice that phone and fax numbers are only printed if e-mail addresses are printed.

Other options are provided by the package, but when used with the class these are silently ignored. If you need to override the settings chosen by the class, include the settings *after* the `\documentclass` line using `\setkeys`:

```
\documentclass[journal = jacsat]{achemso}
\setkeys{acs}{articletitle = false}
```

4.2 Manuscript meta-data

\author Inspired by REV_TE_X, the `achemso` class alters the method for adding author \affiliation information to the manuscript. Each author should be given as a separate \author \alsoaffiliation command. These should be followed by an \affiliation, which applies to the \altaffiliation preceding authors. The \affiliation macro takes an optional argument, for a \email short version of the affiliation.² At least one author should be followed by an \email macro, containing contact details. All authors with an e-mail address are automatically marked with a star. The example manuscript demonstrates the use of all of these macros. Notice that \alsoaffiliation is used when one (or more) authors work at multiple institutions, while \altaffiliation is intended for previous addresses (or other notes). Only \affiliation applies to multiple authors: both \alsoaffiliation and \altaffiliation are set on a per author basis.

```
\author{Author Person}
\author{Second Bloke}
\email{second.bloke@some.place}
\affiliation[University of Sometown]
    {University of Somewhere, Sometown, USA}
\altaffiliation
    {Previous address: Minute University, Nowhereville, USA}
\author{Indus Trialguy}
\email{i.trialguy@sponsor.co}
\affiliation[SponsoCo]
    {Research Department, SponsorCo, BigCity, USA}
\alsoaffiliation{University of Somewhere, Sometown, USA}
```

Repeated entries for \affiliation and \alsoaffiliation will result in only one address being printed in the address list and footnotes. Repeated \altaffiliation entries only produce a single footnote, and can therefore be used for entries such as

```
\author{First Coworker}
\altaffiliation{Contributed equally to this work}
\author{Second Coworker}
\altaffiliation{Contributed equally to this work}
```

if required.

\fax The class will recognise the optional information \fax and \phone, which will \phone be printed along with the lead authors e-mail address. Note that this information is only used for authors who have an e-mail address supplied.

```
\author{Second Bloke}
\email{second.bloke@some.place}
\phone{+xxx (0)yyy zzzzzz}
\fax{+xxx (0)yyy wwwww}
\affiliation[University of Sometown]
    {University of Somewhere, Sometown, USA}
```

\and The method used for setting the meta-data means that the normal \and and \thanks \thanks macros are not appropriate in the `pkgachemso` class. Both produce a warning if used.

\title The \title macro is extended to accept an optional argument. This is

²This will usually be the university or company name.

intended for a shortened version of the journal title suitable for running headers. Some journals require that authors supply this data: if it is needed then it will be printed in the appropriate place.

```
\title[Short running title]
      {Long title which would not fit in running headers}
```

The meta-data items should be given in the preamble to the L^AT_EX file, and no \maketitle macro is required in the document body. This is all handled by the class file directly. At least one author, affiliation and e-mail address must be specified.

4.3 Floats

scheme (*env.*) The class defines three new floating environments: **scheme**, **chart** and **graph**.

chart (*env.*) These can be used as expected to include graphical content. The placement of **graph** (*env.*) these new floats and the standard **table** and **figure** floats is altered to be “here” if possible. The contents of all floats is automatically horizontally centred on the page.

4.4 Section headers

\SectionNumbersOff Some journals have no section numbering by default. This can be set up in \SectionNumbersOn the appropriate configuration file, but it may be that individual users need to change the decision. The macros \SectionNumbersOff and \SectionNumbersOn are therefore available: these should be given in the preamble.

\SectionsOff More radically, the entire availability of sections can be turned on and off. This \SectionsOn functionality is available to the user *via* the \SectionsOn and \SectionsOff \AbstractOff macros, which again are preamble-only. Similar functions are available for the \AbstractOn abstract: \AbstractOff and \AbstractOn.

4.5 Special sections

acknowledgement (*env.*) The sections for acknowledgements and supporting information have dedicated **suppinfo** (*env.*) environments available. These ensure that the section headings are generated, and that the text is sized correctly when using creating a Communication.

```
\begin{acknowledgement}
  The authors thank A.N.~Other.
\end{acknowledgement}

\begin{suppinfo}
  Full characterization data for all new compounds.
\end{suppinfo}
```

tocentry (*env.*) For generating an entry for the graphical table of content, required by some journals, the environment **tocentry** is available. This prints its content in an appropriately sized box on a separate page. In contrast to the rest of the manuscript, this section is intended to be “print ready” in appearance.

```
\begin{tocentry}
  \includegraphics{toc-entry-graphic}
  Some text to explain the graphic.
\end{tocentry}
```

4.6 Miscellaneous commands

\latin

The command \latin is provided by the class to format Latin phrases such as "et al." Most ACS journals do not make these italic, but some (for example *ACS Nano*) do. By providing a command, the formatting is left flexible.

\doi

The bibliography style prints any doi values as the argument to the command \doi. The default definition will allow printing of special characters but does not create hyperlinks. A more sophisticated version of the command may be set up if `hyperref` is loaded, for example

```
\begin{tocentry}
  \newcommand{\doi}[1]{\href{http://dx.doi.org/#1}{\nolinkurl{#1}}}
\end{tocentry}
```

5 The package file

The `achemso` package is independent of the class file, and contains parts of the bundle useful outside of submission to the ACS.

5.1 Package options

As with the class options, the package uses the key-value method for option set up. These are used to control the output of citations and bibliographic data. The same options are used when creating journal configurations for the class: this is a task most users will not need to undertake!

`super (env.)` The `super` option affects the handling of superscript reference markers. The option switches this behaviour on and off (and takes Boolean values: `super=true` and `super=false` are valid).

`articletitle (env.)` The `articletitle` option is a Boolean, and sets whether the title of a paper referenced appears in the bibliography. The default is `articletitle=true`.

`doi (env.)` The boolean `doi` option is provided to allow a DOI (Digital Object Identifier) to be included for bibliography entries even where other identification such as page numbers is available. The standard setting is `false`: setting it to `true` will cause DOI numbers to be printed if available.

`chaptertitle (env.)` The boolean `chaptertitle` option is provided to allow flexibility for the inclusion of chapter titles for book and related entries. The standard setting is `false`: setting it to `true` will cause chapter titles to be included.

`etalmode (env.)` Many journals require that long lists of authors are shortened using 'et al.' in the references section. The behaviour of the BIBTEX styles in this regard is controlled by two options, `etalmode` and `maxauthors`. There are two possible ways to shorten a long list of authors. Some journals require that only the first author is given, followed by 'et al.': for this behaviour, set `etalmode=firstronly`:

Jones, A.N. et al.

On the other hand, some journals request that the list of authors is truncated after n authors. This is set up by the `etalmode=truncate` option:

Jones, A.N.; Bloggs, F.; Nobacon, D. et al.

In both cases, the maximum number of authors permitted before introducing ‘et al.’ is governed by the `maxauthors` option. This option recognises the sentinel value 0, which indicates that no shortening should occur at all.

`biblabel` (*env.*) Redefining the formatting of the numbers used in the bibliography usually requires modifying internal L^AT_EX macros. The `biblabel` option makes these changes more accessible: valid values are `plain` (use the number only), `brackets` (surround the number in brackets) and `period` or `fullstop` (follow the number by a full stop/period).

`biochem` (*env.*) `biochemistry` (*env.*) Most ACS journals use the same bibliography style, with the only variation being the inclusion of article titles. However, a small number of journals use a rather different style; the journal *Biochemistry* is probably the most prominent. The `biochemistry` or `biochem` option uses the style of *Biochemistry* for the bibliography, rather than the normal ACS style.

5.2 Bibliography notes

`\bibnote` `achemso` provides the `\bibnote` macro. This is intended for addition of notes `\bibnotemark` to the bibliography (references). The macro accepts a single argument, which is `\bibnotetext` transferred to the bibliography by BIBTEX. In analogy to `\footnote`, the macros `\bibnotemark` and `\bibnotetext` are available for dividing up the marker for a note from the text.

```
Some text \bibnote{This note text will be in the bibliography}.  
Some text.1
```

The functionality for bibnotes in `achemso` is based on that in the `notes2bib` package. The `notes2bib` package can be loaded with the `achemso` package, and no clash will occur. With the class file, `notes2bib` will be ignored if requested, to prevent issues on submission to the ACS.

6 The BibTEX style files

`achemso` is supplied with two style files, `achemso.bst` and `biochem.bst`. The direct use of these without the `achemso` package file is not recommended, but is possible. The style files can be loaded in the usual way, with a `\bibliographystyle` command. The `natbib` package must be loaded by the L^AT_EX file concerned, if the `achemso` package is not in use.

The style files are designed to use the `mciteplus` package if it is available, but to work even if it is not. When `mciteplus` is present, it is possible to automatically produce references of the form

(5) (a) Arduengo, A. J., III; Dias, H. V. R.; Harlow, R. L.; Kline, M. *J. Am. Chem. Soc.* **1992**, *114*, 5530–5534; (b) Appelhans, L. N.; Zuccaccia, D.; Kovacevic, A.; Chianese, A. R.; Miecznikowski, J. R.; Macchioni, A.; Clot, E.; Eisenstein, O.; Crabtree, R. H. *J. Am. Chem. Soc.* **2005**, *127*, 16299–16311; (c) Arduengo, A. J., III; Gamper, S. F.; Calabrese, J. C.; Davidson, F. *J. Am. Chem. Soc.* **1994**, *116*, 4391–4394.

as demonstrated in the example document. When `mciteplus` is not present, this functionality is not available but the style files will work normally.

The BibTeX style files implement the bibliographic style specified by the ACS in *The ACS Style Guide*.² By default, article titles are not included in output using the achemso.bst file, but are with the biochem.bst file.

The style used by the ACS does not differentiate between BibTeX book, inbook, collection and incollection entries. As a result, the appearance of these entry types depends on the fields available. Named subdivisions of a book (for example, chapters where each has a named author) should be given in the title field, with the title of the book itself in the booktitle field. The chapter field should be used for a chapter number, and is printed as part of the pagination.

One frequently asked question is why some people see an empty first item in their bibliography when using the achemso package or class. This is usually because they have downloaded the LATEX files and done a local installation without also updating the BibTeX style. The two must be from the same version of achemso: they are designed to work together.

7 The natmove package

The natmove package does only one job. It brings the ability to move punctuation after citations, using code borrowed from the cite package. Both the achemso class and package load natmove automatically.

```
Some text \cite{Coghill2006} some more text.\\
Some text ending a sentence \cite{Coghill2006}.\.
Some text2 some more text.
Some text ending a sentence.2
```

This is deactivated for other citation types.

```
Some text \citeyear{Coghill2006}.\\
Some text \citeauthor{Coghill2006}.\\
Some text \citenum{Coghill2006}.\.
Some text 2006.
Some text Coghill and Garson.
Some text 2.
```

The package does nothing if the super option has not been given to natbib. This means that the source can be written without needing to decide where citations will to appear, with the super option for natbib controlling the result.

\natmovechars One user macro is provided: \natmovechars. This contains the characters which are moved before superscript punctuation. The default contents is ,;: and can be set using \renewcommand*:

```
\renewcommand*{\natmovechars}{.}
Some text2, more text.2
Some text \cite{Coghill2006},
more text \cite{Coghill2006}.
```

8 Implementation

A lot of the work done by the package is also needed by the class. Loading the package and the class makes load-order awkward. Instead, the two parts are done in one place. Sandwiching the common code are two slices of dedicated

material for the class and the package. Some of this is needed “early”, before the common material, whilst the rest is “late”.

8.1 Early class-only code

So that there is no confusion, the base class is loaded early.

```
1 <*class>
2 \ProvidesClass{achemso}
3 [2025-04-11 v3.13j Submission to ACS journals]
4 \LoadClass[12pt,letter]{article}
```

\acs@warning The code for a warning is created so that it works for the package too.

```
5 \newcommand*\acs@warning{\ClassWarning{achemso}}
6 </class>
```

8.2 Early package-only code

The package and the class should not both be loaded, as the two use the same internal macro names. On the other hand, if the class is not in use a reminder is printed to use it if possible.

```
7 <*package>
8 \ProvidesPackage{achemso}
9 [2025-04-11 v3.13j Support for ACS journals]
10 \@ifclassloaded{achemso}{%
11   \PackageInfo{achemso}{%
12     You have already loaded the ‘achemso’ class:\MessageBreak
13     loading the package will abort%
14   }%
15   \endinput
16 }%
17 \PackageInfo{achemso}{%
18   When writing a submission to an ACS journal, please\MessageBreak
19   use the achemso document class%
20 }%
21 }
```

\acs@warning The code for a warning is created so that it works for the class too.

```
22 \newcommand*\acs@warning{\PackageWarning{achemso}}
23 </package>
```

8.3 Common code

\acs@ifundefined A non-expandable test for defined macros: does not add to the hash table.

```
24 <*package | class>
25 \newcommand*\acs@ifundefined[1]{%
26   \begingroup\expandafter\expandafter\expandafter\endgroup
27   \expandafter\ifx\csname #1\endcsname\relax
28     \expandafter\@firstoftwo
29   \else
30     \expandafter\@secondoftwo
31   \fi
32 }
```

The first stage needed is to read the package options given. Although `xkeyval` was perhaps not the best choice, changing this now would be rather risky.

```
33 \RequirePackage{xkeyval}
```

`\acs@keyval@bool` A support macro for making Boolean options: the `xkeyval` version is only available in newer releases.

```
34 \newcommand*\acs@keyval@bool[2]{%
35   \acs@ifundefined{acs@#1#2}{%
36     \acs@warning{Unknown option '#2' for key #1}%
37   }{%
38     \@nameuse{acs@#1#2}%
39   }%
40 }
```

`\ifacs@abbreviations` These are all very trivial definitions: to avoid issues with older versions of `xkeyval`
`\ifacs@articletitle` each definition is done directly.

```
41 \newif\ifacs@abbreviations
42 \newif\ifacs@articletitle
43 \newif\ifacs@biochem
44 \newif\ifacs@doi
45 \newif\ifacs@chaptertitle
46 \newif\ifacs@email
47 \newif\ifacs@hyperref
48 \newif\ifacs@keywords
49 \newif\ifacs@super
50 \define@key{acs}{abbreviations}[true]{%
51   \acs@keyval@bool{abbreviations}{#1}%
52 }
53 \define@key{acs}{articletitle}[true]{%
54   \acs@keyval@bool{articletitle}{#1}%
55 }
56 \define@key{acs}{biochem}[true]{%
57   \acs@keyval@bool{biochem}{#1}%
58 }
59 \define@key{acs}{doi}[true]{%
60   \acs@keyval@bool{doi}{#1}%
61 }
62 \define@key{acs}{chaptertitle}[true]{%
63   \acs@keyval@bool{chaptertitle}{#1}%
64 }
65 \define@key{acs}{email}[true]{%
66   \acs@keyval@bool@email}{#1}%
67 }
68 \define@key{acs}{hyperref}[true]{%
69   \acs@keyval@bool{hyperref}{#1}%
70 }
71 \define@key{acs}{keywords}[true]{%
72   \acs@keyval@bool{keywords}{#1}%
73 }
74 \define@key{acs}{super}[true]{%
75   \acs@keyval@bool{super}{#1}%
76 }
77 \define@key{acs}{usetitle}[true]{%
```

```

78   \acs@keyval@bool{articletitle}{#1}%
79 }

\acs@journal Trivial again: done without using xkeyval for the same reasons as before.
\acs@layout 80 \newcommand*\acs@journal{jacsat}
\acs@manuscript 81 \newcommand*\acs@layout{traditional}
\acs@maxauthors 82 \newcommand*\acs@manuscript{article}
83 \newcommand*\acs@maxauthors{15}
84 \define@key{acs}{journal}{%
85   \def\acs@journal{#1}%
86 }
87 \define@key{acs}{layout}{%
88   \def\acs@layout{#1}%
89 }
90 \define@key{acs}{manuscript}{%
91   \def\acs@manuscript{#1}%
92 }
93 \define@key{acs}{maxauthors}{%
94   \def\acs@maxauthors{#1}%
95 }

\ifacs@etal@truncate The setup for the etalmode option is quite simple: just look for the appropriate
\acs@etal@firstonly macros.
\acs@etal@truncate 96 \newif\ifacs@etal@truncate
97 \define@key{acs}{etalmode}{%
98   \acs@ifundefined{acs@etal@#1}{%
99     \acs@warning{%
100       Unknown value '#1' for\MessageBreak etalmode option%
101     }%
102   }{%
103     \nameuse{acs@etal@#1}%
104   }%
105 }
106 \newcommand*\acs@etal@firstonly{\acs@etal@truncatefalse}
107 \newcommand*\acs@etal@truncate{\acs@etal@truncatetrue}

\acs@activate@biblabel The biochemistry option is an alias for biochem. The biblabel option is a
choice, which is implemented using a csname search. The group here prevents
hash table pollution, whilst the xkeyval method is avoided as it is more complex
than it is worth!
108 \define@key{acs}{biochemistry}{%
109   \setkeys{acs}{biochem = #1}%
110 }
111 \define@key{acs}{biblabel}{%
112   \acs@ifundefined{acs@biblabel@#1}{%
113     \acs@warning{%
114       Unknown value '#1' for\MessageBreak biblabel option%
115     }%
116   }{%
117     \acs@activate@biblabel{\nameuse{acs@biblabel@#1}}%
118   }%
119 }
120 \newcommand*\acs@activate@biblabel{}

```

```

121 <*class>
122 \let\acs@activate@biblabel\AtEndOfClass
123 \AtEndOfClass{\let\acs@activate@biblabel\@firstofone}
124 
```

\acs@biblabel@brackets The macros to implement the idea above for biblabels.

```

125 
```

\acs@biblabel@fullstop \newcommand*\acs@biblabel@brackets{\def\bibnumfmt##1{##1}}
\acs@biblabel@period \newcommand*\acs@biblabel@fullstop{\def\bibnumfmt##1{##1.}}
\acs@biblabel@plain \newcommand*\acs@biblabel@period{\def\bibnumfmt##1{##1.}}
\newcommand*\acs@biblabel@plain{\def\bibnumfmt##1{##1}}

```

126 
```

Set up some defaults.

```

127 \setkeys{acs}{
128   email = true,
129   super = true
130 }
```

Loading some other packages depends on the options chosen, so they are processed now.

```

131 \ProcessOptionsX*{acs}
```

\acs@manuscript@communication For text comparisons.

```

132 \newcommand*\acs@manuscript@communication{communication}
133 \newcommand*\acs@manuscript@letter{letter}
134 \newcommand*\acs@manuscript@note{note}
135 \newcommand*\acs@manuscript@review{review}
136 \newcommand*\acs@manuscript@suppinfo{suppinfo}
```

\acs@niib@create To avoid needing to load the notes2bib package, especially as the plan is to move bibnote that package to L^AT_EX3 internal syntax, achemso provides a minimal version \thebibnote here. The first step is to create macros which will need a guard against notes2bib \bibnote already having been loaded. To allow the package and class to behave differently \bibnotemark these are actually applied later.

```

137 \newcommand*\acs@niib@create{%
138   \c@namedef{ver@notes2bib.sty}{%
139     2009/04/20 v1.6a Integrating notes into the bibliography (achemso
140     version)
141   }%
142   \c@ifundefined{c@bibnote}{\newcounter{bibnote}}{%
143     \def\thebibnote{%
144       Note-\the\value{bibnote}%
145     }%
146     \c@DeclareRobustCommand*{\bibnote}[1][\thebibnote]{%
147       \stepcounter{bibnote}%
148       \def\acs@niib@after@text{\cite{##1}}%
149       \acs@niib@text{##1}%
150     }%
151     \c@DeclareRobustCommand*{\bibnotemark}[1][\thebibnote]{%
152       \stepcounter{bibnote}%
153       \def\acs@niib@after@text{\cite{##1}}%

252 \newcommand*\acs@bib@name{acs-\jobname.bib}

```

`\acs@bib@write` The control information for BIB_TE_X needs to be written to a special file. The main `\acs@bib@write@aux` writing macro is quite simple. Actually writing the information is left to the code for `\bibliography`, so that this only happens if needed.

\acs@bibliography The \bibliography macro is now patched so that everything works correctly.

```
\bibliography 291 \AtBeginDocument{%
 292   \let\acs@bibliography\bibliography
 293   \def\bibliography#1{%
 294     \acs@bibliography{\acs-\jobname,#1}%
 295   }%
 296 }
```

\latin The journal *ACS Nano* formats Latin phrases differently from every other ACS journal: we provide a \latin command to cover this.

297 \AtBeginDocument{

```

298 \providecommand{\latin}[1]{\#1}
299 }
300 </package | class>

```

8.4 Late class-only code

Most of the power of the class is now created. First, a few options are reset so that any given by the user are effectively ignored.

```

301 {*class}
302 \setkeys{acs}{
303   abbreviations = false,
304   articletitle = true,
305   biblabel = brackets,
306   biochem = false,
307   doi = false,
308   etalmode = firstonly,
309   keywords = false,
310   maxauthors = 15,
311   super = true
312 }

```

When using the class, notes2bib is always emulated. Other standard support packages can now be loaded.

```

313 \acs@niib@create
314 \RequirePackage[margin=2.54cm]{geometry}
315 \RequirePackage{
316   caption,
317   float,
318   graphicx,
319   setspace,
320   url
321 }
322 \ifacs@hyperref
323   \expandafter\RequirePackage
324 \else
325   \expandafter\gobble
326 \fi
327 {hyperref}
328 \AtBeginDocument{\doublespacing}

```

\title For the meta-data, the REV_TE_X bundle provides a good model for the commands \@title to give the author. \gdef is used here to avoid any odd grouping issues.

```

\citemenumfont Changes to citations can now be made. The citation styles supplied here require `natbib`, which is loaded with the appropriate options. This part applies to the package as well as the class: it is here so that the load order is correct.

```

1402 (*class | package)
1403 \ifacs@super
1404   \RequirePackage[sort&compress,numbers,super]{natbib}
1405 \else
1406   \RequirePackage[sort&compress,numbers,round]{natbib}
1407   \def\citemenumfont{\textit}
1408 \fi
1409 \define@key{acs}{super}[true]{%
1410   \def\@tempa{#1}%
1411   \def\@tempb{true}%
1412   \ifx\@tempa\@tempb
1413     \setcitetstyle{super,open={},close={}}%
1414     \renewcommand*\citemenumfont{}%
1415   \else
1416     \setcitetstyle{round}%
1417     \renewcommand*\citemenumfont{\textit}%
1418   \fi
1419 }
1420 \RequirePackage{natmove}

```

The `mciteplus` package allows the construction of lists of references with sub-letters. However, it might not be available, and so it is only loaded if available: the `.bst` files should work either way. There is also a patch to get cross-references correct with the modified `\ref` macro used here. The reason for ensuring that `\@mciteNatbibCiteCmdList` is defined is that it allows for the case where people prevent `mciteplus` being loaded using `\ver@mciteplus.sty`.

```

1421 \IfFileExists{mciteplus.sty}{%
1422   \RequirePackage{mciteplus}
1423   \providecommand*\{@mciteNatbibCiteCmdList}{}%
1424   \edef\@tempa{\noexpand\in@{citemenum}{\@mciteNatbibCiteCmdList}}%

```

```

1425  \tempa
1426  \ifin@
1427  \else
1428    \edef\@mciteNatbibCiteCmdList{\@mciteNatbibCiteCmdList,citemum}%
1429  \fi
1430 (*!package)
1431  \def\@mciteSubRef[##1]##2{\plainref{\@mcitereflabelprefix:##1:##2}}
1432 (/!package)
1433 }{}
```

\acs@bibstyle The next step is to sort out bibliography formatting. With both the package and the class, the bibliography style is determined without user intervention. The style is stored as it may need to be altered later.

```

1434 \newcommand*\acs@bibstyle{achemso}
1435 \ifacs@biochem
1436   \def\acs@bibstyle{biochem}
1437   \bibliographystyle{biochem}
1438 \else
1439   \bibliographystyle{achemso}
1440 \fi
```

\acs@bibliographystyle The original \bibliographystyle macro is now disabled: the underlying command \bibliographystyle mand is repeated otherwise problems cop up with chapterbib.

```

1441 \newcommand*\acs@bibliographystyle{}
1442 \let\acs@bibliographystyle\bibliographystyle
1443 \def\bibliographystyle#1{%
1444   \acs@warning{\string\bibliographystyle\space ignored}%
1445   \expandafter\acs@bibliographystyle\expandafter{\acs@bibstyle}%
1446 }
1447 (/class | package)
```

8.6 Late package-only code

The notes2bib code may or may not be activated.

```

1448 (*package)
1449 \AtBeginDocument{%
1450   \@ifpackageloaded{notes2bib}{}{%
1451     \acs@niib@create
1452   }%
1453 }
1454 (/package)
```

8.7 Moving citations with natbib

The code for moving citations is created as a separate package, as the code needed is the same in both cases.

```

1455 (*natmove)
1456 \ProvidesPackage{natmove}
1457 [2010/01/15 v1.1a Automatic citation moving with natbib]
1458 \RequirePackage{natbib}
```

`\nmv@ifmtarg` To keep down dependence on other packages, the very short code block from `\nmv@xifmtarg` ifmtarg is copied here with an internal name.

```
1459 \newcommand*\nmv@ifmtarg{}  
1460 \newcommand*\nmv@xifmtarg{}  
1461 \begingroup  
1462   \catcode`\Q 3\relax  
1463   \long\gdef\nmv@ifmtarg#1{  
1464     \nmv@xifmtarg#1QQ\@secondoftwo\@firstoftwo\@nil  
1465   }  
1466   \long\gdef\nmv@xifmtarg#1#2Q#3#4#5\@nil{#4}  
1467 \endgroup
```

`\ifnmv@cite` A flag is need to watch whether `\cite` or another macro is in use.

```
1468 \newif\ifnmv@cite
```

`\nmv@citex` Using the flag, either the new internal macro, or the natbib original, can be called.

```
1469 \newcommand*\nmv@citex{  
1470   \ifnmv@cite  
1471     \expandafter\nmv@citex@moving  
1472   \else  
1473     \expandafter\nmv@citex@nat  
1474   \fi  
1475 }
```

`\nmv@after` Later, the argument for `\cite` will need to be saved.

```
1476 \newcommand*\nmv@after{}
```

`\nmv@citex@moving` The new version of `\@citex` is needed that looks ahead of the citation using `\futurelet`. There are three arguments to `\@citex` when using natbib. Other than that, the trick used here is similar to that in `cite`.

```
1477 \newcommand*\nmv@citex@moving{}  
1478 \def\nmv@citex@moving[#1] [#2] #3{  
1479   \leavevmode  
1480   \skip@\lastskip\relax  
1481   \unskip  
1482   \begingroup  
1483     \def\nmv@after{\nmv@citex@nat[#1] [#2] {#3}}%  
1484     \global\nmv@citefalse  
1485     \nmv@citex@get@next\relax  
1486 }
```

`\nmv@citex@end` To get things right at the end.

```
1487 \newcommand*\nmv@citex@end{  
1488   \nmv@after  
1489   \endgroup  
1490 }
```

`\nmv@citex@get@next` The next token on the input stack is saved into `\nmv@citex@next`, after gobbling `\nmv@citex@next` up one token.

```
1491 \newcommand*\nmv@citex@get@next[1]{  
1492   \futurelet\nmv@citex@next\nmv@citex@punct  
1493 }
```

`\nmv@citex@punct` The working macro for moving the punctuation. This is very much like `\citey` `\nmv@citex@punct@undouble` in the `cite` package. The initial assumption is that the loop will terminate, and so `\nmv@citex@loop` the recursion call will simply do the finalisation.

```

1494 \newcommand*\nmv@citex@punct{%
1495   \let\nmv@citex@loop\nmv@citex@end
1496   \ifx\nmv@citex@next.\relax
1497     \ifnum\spacefactor<\nmv@citex@sfac\else
1498       \expandafter\expandafter\expandafter\nmv@citex@punct@undouble
1499     \fi
1500   \fi
1501   \expandafter\expandafter\expandafter\nmv@citex@punct@aux\natmovechars@nil
1502   \nmv@citex@loop
1503 }
1504 \newcommand*\nmv@citex@punct@undouble{%
1505   \let\nmv@citex@next\relax
1506   \let\nmv@citex@loop\nmv@citex@get@next
1507 }
1508 \newcommand*\nmv@citex@loop{}  

```

`\nmv@citex@punct@aux` The final part of the punctuation moving system.

```

1509 \newcommand*\nmv@citex@punct@aux[1]{%
1510   \ifx\nmv@citex@next#1\empty
1511     #1%
1512   \let\nmv@citex@loop\nmv@citex@get@next
1513   \fi
1514   \ifx#1\@nil\else
1515     \expandafter\nmv@citex@punct@aux
1516   \fi
1517 }  

```

`\nmv@citex@sfac` The value of the spacing factor after a full stop is used to signal doubled punctuation. For French spacing, a bit of patching is needed.

```

1518 \mathchardef\nmv@citex@sfac3000\relax
1519 \expandafter\def\expandafter\frenchspacing\expandafter{%
1520   \frenchspacing
1521   \mathchardef\nmv@citex@sfac1001\relax
1522   \sfcode`\.\nmv@citex@sfac
1523   \sfcode`?\nmv@citex@sfac
1524   \sfcode`!\nmv@citex@sfac
1525 }
1526 \ifnum\sfcode`\.=\@m
1527   \frenchspacing
1528 \fi  

```

`\nmv@citex@nat` The swap has to be done at the beginning of the document. The internal flag `\nmv@activate` from `natbib` is used, but under the circumstances we should be safe. `\cite` is also `\cite` patched to make the system active.

```

1529 \newcommand*\nmv@citex@nat{}
1530 \newcommand*\nmv@activate{%
1531   \let\nmv@citex@nat@\citex
1532   \let@\citex\nmv@citex
1533   \let\nmv@cite\cite
1534   \renewcommand*\cite}[2][]{%  

```

```

1535     \nmv@ifmtarg{##1}{%
1536         \nmv@citetrue
1537         \nmv@cite{##2}%
1538     }{%
1539         \nmv@citefalse
1540         \nmv@cite[##1]{##2}%
1541     }%
1542 }

```

\nmv@natbib@detect So that natbib options can be set without worrying about load order, natmove doesn't require natbib. So a test is needed to see if it is actually loaded. This is done as a macro so that the effect can be changed by achemso.

```

1543 \newcommand*\nmv@natbib@detect{%
1544     \@ifpackageloaded{natbib}{%
1545         \ifNAT@super
1546             \expandafter\nmv@activate
1547         \fi
1548     }{%
1549         \PackageInfo{natmove}{%
1550             The natbib package is not loaded.\MessageBreak
1551             Loading natmove will do nothing
1552         }%
1553     }%
1554 }
1555 \AtBeginDocument{\nmv@natbib@detect}

```

\natmovechars A user macro is needed for moving characters.

```

1556 \newcommand*\natmovechars{.,;:}
1557 </natmove>

```

8.8 The configuration files

The configuration files for different journals are not very complex. Keeping everything separate simply helps with maintenance.

```
