

# The **calculator** and **calculus** packages\*

## Scientific calculations with L<sup>A</sup>T<sub>E</sub>X

Robert Fuster  
Universitat Politècnica de València  
`rfuster@mat.upv.es`

2022/09/15

### Abstract

The **calculator** package allows us to use L<sup>A</sup>T<sub>E</sub>X as a calculator, with which we can perform many of the common scientific calculations (with the limitation in accuracy imposed by the T<sub>E</sub>X arithmetic).

This package introduces several new instructions that allow you to do several calculations with integer and decimal numbers using L<sup>A</sup>T<sub>E</sub>X. Apart from add, multiply or divide, we can calculate powers, square roots, logarithms, trigonometric and hyperbolic functions ...

In addition, the **calculator** package supports some elementary calculations with vectors in two and three dimensions and square  $2 \times 2$  and  $3 \times 3$  matrices.

The **calculus** package adds to the **calculator** package several utilities to use and define various functions and their derivatives, including elementary functions, operations with functions, polar coordinates and vector-valued real functions.

Version 2.0 adds new capabilities to both packages. Specifically, now, **calculator** and **calculus** can evaluate the inverse trigonometric and the inverse hyperbolic functions (so that we can work with all the classic elementary functions), and also can do some additional calculation with vectors (such as the cross product and the angle between two vectors).

Version 2.1 fixes some bugs and calculation problems.<sup>1</sup>

## Contents

### 1 Introduction

The **calculator** package defines some instructions which allow us to realize algebraic operations (and to evaluate elementary functions) in our documents. The operations implemented by the **calculator** package include routines of assignment of variables, arithmetical calculations with real and integer numbers, two and three dimensional vector and matrix arithmetics and the computation of square roots, trigonometrical, exponential, logarithmic and hyperbolic functions. In addition, some important numbers, such as  $\sqrt{2}$ ,  $\pi$  or  $e$ , are predefined.

---

\*This document corresponds to **calculator** v.2.1 and **calculus** v.2.1, dated 2022/09/15.

<sup>1</sup>Thanks to Schmitz Manuel, Thorsten Wolterin, Jim Cline, Schremmer Alain and July Tikhonov.

The name of all these commands is spelled in capital letters (with very few exceptions: the commands `\DEGtoRAD` and `\RADtoDEG` and the control sequences that define special numbers, as `\numberPI`) and, in general, they all need one or more mandatory arguments, the first one(s) of which is(are) number(s) and the last one(s) is(are) the name(s) of the command(s) where the results will be stored.<sup>2</sup> The new commands defined in this way work in any L<sup>A</sup>T<sub>E</sub>X mode.

By example, this instruction

```
\MAX{3}{5}{\solution}
```

stores 5 in the command `\solution`. In a similar way,

```
\FRACTIONSIMPLIFY{10}{12}{\numerator}{\denominator}
```

defines `\numerator` and `\denominator` as 5 i 6, respectively.

The *data* arguments should not be necessarily explicit numbers; it may also consist in commands the value of which is a number. This allows us to chain several calculations, since in the following example:

**Ex. 1**

$$\begin{aligned}\frac{2.5^2}{\sqrt{12}} + e^{3.4} &= \frac{6.25}{3.4641} + 29.96432 \\ &= 1.80421 + 29.96432 \\ &= 31.76854\end{aligned}$$

```
% \tempA=2.5^2
\SQUARE{2.5}{\tempA}
% \tempB=sqrt(12)
\SQAREROOT{12}{\tempB}
% \tempC=exp(3,4)
\EXP{3.4}{\tempC}
% \divisio=\tempA/\tempB
\DIVIDE{\tempA}{\tempB}{\divisio}
% \sol=\divisio+\tempC
\ADD{\divisio}{\tempC}{\sol}
\begin{align*}
\frac{2.5^2}{\sqrt{12}}+\mathrm{e}^{3.4} \\
&= \frac{\tempA}{\tempB}+\tempC \\
&= \divisio+\tempC \\
&= \sol
\end{align*}
```

Observe that, in this example, we have followed exactly the same steps that we would do to calculate  $\frac{2.5^2}{\sqrt{12}} + e^{3.4}$  with a standard calculator: We would calculate the square, the root and the exponential and, finally, we would divide and add the results.

It does not matter if the arguments *results* are or not predefined. But these commands act as declarations, so that its scope is local in environments and groups.

---

<sup>2</sup>Logically, the control sequences that represent special numbers (as `\numberPI`) does not need any argument.

### Ex. 2

The `\sol` command contains the square of 5:

$$5^2 = 25$$

Now, the `\sol` command is the square root of 5:

$$\sqrt{5} = 2.23605$$

On having gone out of the `center` environment, the command recovers its previous value: 25

The `calculus` package goes a step further and allows us to define and use in a user-friendly manner various functions and their derivatives.

For example, using the `calculus` package, you can define the  $f(t) = t^2 e^t - \cos 2t$  function as follows:

```
% \PRODUCTfunction{\SQUAREfunction}{\EXPfunction}{\tempfunctionA}
% \SCALEVARIABLEfunction{2}{\COSfunction}{\tempfunctionB}
% \SUBTRACTfunction{\tempfunctionA}{\tempfunctionB}{\Ffunction}
```

Then you can compute any value of the new function `\Ffunction` and its derivative: typing `\Ffunction{(num)}{\sol}{(\Dsol)}` the values of  $f(\textit{num})$  and  $f'(\textit{num})$  will be stored in `\sol` and `\Dsol`.

## Part I

# The calculator package

## 2 Predefined numbers

The `calculator` package predefines the following numbers:

<code>\numberPI</code>	$3.14159 \approx \pi$	<code>\numberHALFPI</code>	$1.57079 \approx \pi/2$
<code>\numberTHREEHALFPI</code>	$4.71237 \approx 3\pi/2$	<code>\numberTHIRDPI</code>	$1.0472 \approx \pi/3$
<code>\numberQUARTERPI</code>	$0.78539 \approx \pi/4$	<code>\numberFIFTHPI</code>	$0.62831 \approx \pi/5$
<code>\numberSIXTHPI</code>	$0.52359 \approx \pi/6$	<code>\numberTWOPI</code>	$6.28317 \approx 2\pi$
<code>\numberE</code>	$2.71828 \approx e$	<code>\numberINVE</code>	$0.36787 \approx 1/e$
<code>\numberETWO</code>	$7.38902 \approx e^2$	<code>\numberINVETWO</code>	$0.13533 \approx 1/e^2$
<code>\numberLOGTEN</code>	$2.30258 \approx \log 10$		
<code>\numberGOLD</code>	$1.61803 \approx \phi$	<code>\numberINVGOLD</code>	$0.61803 \approx 1/\phi$
<code>\numberSQRTTWO</code>	$1.41421 \approx \sqrt{2}$	<code>\numberSQRTHREE</code>	$1.73205 \approx \sqrt{3}$
<code>\numberSQRTFIVE</code>	$2.23607 \approx \sqrt{5}$		
<code>\numberCOSXXX</code>	$0.86603 \approx \cos \pi/6$	<code>\numberCOSXLV</code>	$0.70711 \approx \cos \pi/4$

### 3 Operations with numbers

#### 3.1 Assignments and comparisons

The first command we describe here is used to store a number in a control sequence. The other two commands in this section determine the maximum and minimum of a pair of numbers.

`\COPY{<num>}{{<\cmd>}}` stores the number *num* to the command *\cmd*.

Ex. 3

-1.256

`\COPY{-1.256}{\sol}`  
`\sol`

`\MAX{<num1>}{{<num2>}}{{<\cmd>}}` stores in *\cmd* the maximum of the numbers *num1* and *num2*.

Ex. 4

1.256

`\MAX{1.256}{3.214}{\sol}`  
`\[\max(1.256,3.214)=\sol\]`

$$\max(1.256, 3.214) = 3.214$$

`\MIN{<num1>}{{<num2>}}{{<\cmd>}}` stores in *\cmd* the minimum of *num1* and *num2*.

Ex. 5

3.214

`\MIN{1.256}{3.214}{\sol}`  
`\sol`

#### 3.2 Real arithmetic

##### 3.2.1 The four basic operations

The following commands calculate the four arithmetical basic operations.

`\ADD{<num1>}{{<num2>}}{{<\cmd>}}` Sum of numbers *num1* and *num2*.

Ex. 6

1.256 + 3.214 = 4.47

`\ADD{1.256}{3.214}{\sol}`  
`$1.256+3.214=\sol$`

`\SUBTRACT{<num1>}{{<num2>}}{{<\cmd>}}` Difference *num1 - num2*.

Ex. 7

1.256 - 3.214 = -1.95801

`\SUBTRACT{1.256}{3.214}{\sol}`  
`$1.256-3.214=\sol$`

\MULTIPLY{\num1}{\num2}{\cmd} Product  $\num1 \times \num2$ .

Ex. 8

$$1.256 \times 3.214 = 4.03677$$

\MULTIPLY{1.256}{3.214}{\sol}  
\$1.256\times3.214=\sol\$

\DIVIDE{\num1}{\num2}{\cmd} Quotient  $\num1 / \num2$ .<sup>3</sup>

Ex. 9

$$1.256/3.214 = 0.39078$$

\DIVIDE{1.256}{3.214}{\sol}  
\$1.256/3.214=\sol\$

### 3.2.2 Powers with integer exponent

\SQUARE{\num}{\cmd} Square of the number  $\num$ .

Ex. 10

$$(-1.256)^2 = 1.57751$$

\SQUARE{-1.256}{\sol}  
\$(-1.256)^2=\sol\$

\CUBE{\num}{\cmd} Cube of  $\num$ .

Ex. 11

$$(-1.256)^3 = -1.98134$$

\CUBE{-1.256}{\sol}  
\$(-1.256)^3=\sol\$

\POWER{\num}{\exp}{\cmd} The  $\exp$  power of  $\num$ .

The exponent,  $\exp$ , must be an integer (if you want to calculate powers with non integer exponents, use the \EXP command).

Ex. 12

$$\begin{aligned} (-1.256)^{-5} &= -0.31989 \\ (-1.256)^5 &= -3.1256 \\ (-1.256)^0 &= 1 \end{aligned}$$

```
\POWER{-1.256}{-5}{\sola}
\POWER{-1.256}{5}{\solb}
\POWER{-1.256}{0}{\solc}
\[
\begin{aligned}
(-1.256)^{-5} &= \sola \\
(-1.256)^5 &= \solb \\
(-1.256)^0 &= \solc
\end{aligned}
\]
\]
```

---

<sup>3</sup>This command uses a modified version of the division algorithm of Claudio Beccari.

### 3.2.3 Absolute value, integer part and fractional part

`\ABSVALUE{<num>}{|<\cmd>}` Absolute value of *num*.

Ex. 13

$$|-1.256| = 1.256$$

```
\ABSVALUE{-1.256}{\sol}
$\left|-1.256\right|=\sol$
```

`\INTEGERPART{<num>}{|<\cmd>}` Integer part of *num*.<sup>4</sup>

Ex. 14

The integer part of 1.256 is 1, but the integer part of  $-1.256$  is  $-2$ .

```
\INTEGERPART{1.256}{\sola}
\INTEGERPART{-1.256}{\solb}
The integer part of $1.256$ is $\sola$,
but the integer part of $-1.256$ is $\solb$.
```

`\FLOOR` is an alias of `\INTEGERPART`.

Ex. 15

The integer part of 1.256 is 1.

```
\FLOOR{1.256}{\sol}
The integer part of $1.256$ is $\sol$.
```

`\FRACTIONALPART{<num>}{|<\cmd>}` Fractional part of *num*.<sup>5</sup>

Ex. 16

$$\begin{array}{l} 0.256 \\ 0.744 \end{array}$$

```
\FRACTIONALPART{1.256}{\sol}
\sol

\FRACTIONALPART{-1.256}{\sol}
\sol
```

### 3.2.4 Truncation and rounding

`\TRUNCATE[<n>]{<num>}{|<\cmd>}` truncates the number *num* to *n* decimal places.

`\ROUND[n]{<num>}{|<\cmd>}` rounds the number *num* to *n* decimal places.<sup>6</sup>

The optional argument *n* may be 0, 1, 2, 3 or 4 (the default is 2).<sup>7</sup>

Ex. 17

$$\begin{array}{l} 1 \\ 1.25 \\ 1.2568 \end{array}$$

```
\TRUNCATE[0]{1.25688}{\sol}
\sol

\TRUNCATE[2]{1.25688}{\sol}
\sol

\TRUNCATE[4]{1.25688}{\sol}
\sol
```

<sup>4</sup>The integer part of *x* is the largest integer that is less than or equal to *x*.

<sup>5</sup>code modified in version 2.1 (thanks to July Tikhonov who reported a bug and suggested the solution).

<sup>6</sup>code modified in version 2.1 (thanks to Jim Cline and Schremmer Alain who reported a bug).

<sup>7</sup>Note that `\TRUNCATE[0]` is equivalent to `\INTEGERPART` only for non-negative numbers.

Ex. 18

1  
1.26  
1.2569

\ROUND[0]{1.25688}{\sol}  
\sol

\ROUND[2]{1.25688}{\sol}  
\sol

\ROUND[4]{1.25688}{\sol}  
\sol

### 3.3 Integers

The operations described here are subject to the same restrictions as those referring to decimal numbers. In particular, although TeX does not have this restriction in its integer arithmetic, the largest integer that can be used is 16383.

#### 3.3.1 Integer division, quotient and remainder

\INTEGERDIVISION{*num1*}{*num2*}{{*cmd1*}}{*cmd2*} stores in the \i{cmd1} and \i{cmd2} commands the quotient and the remainder of the integer division of the two integers *num1* and *num2*. The remainder is a non-negative number smaller than the divisor.<sup>8</sup>

Ex. 19

$$\begin{aligned} 435 &= 27 \times 16 + 3 \\ 27 &= 435 \times 0 + 27 \\ -435 &= 27 \times (-17) + 24 \\ 435 &= -27 \times (-16) + 3 \\ -435 &= -27 \times 17 + 24 \end{aligned}$$

\INTEGERDIVISION{435}{27}{\sola}{\solb}  
\$435=27\times\sola+\solb\$

\INTEGERDIVISION{27}{435}{\sola}{\solb}  
\$27=435\times\sola+\solb\$

\INTEGERDIVISION{-435}{27}{\sola}{\solb}  
\$-435=27\times(\sola)+\solb\$

\INTEGERDIVISION{435}{-27}{\sola}{\solb}  
\$435=-27\times(\sola)+\solb\$

\INTEGERDIVISION{-435}{-27}{\sola}{\solb}  
\$-435=-27\times\sola+\solb\$

\INTEGERQUOTIENT{*num1*}{*num2*}{{*cmd*}} Integer part of the quotient of *num1* and *num2*. These two numbers are not necessarily integers.

---

<sup>8</sup>The scientific computing systems (such as Matlab, Scilab or Mathematica) do not always return a non-negative residue —especially when the divisor is negative—. However, the most reasonable definition of integer quotient is this one: *the quotient of the division D/d is the largest number q for which dq ≤ D*. With this definition, the remainder  $r = D - qd$  is a non-negative number.

Ex. 20

$$\begin{array}{r} 16 \\ 0 \\ -17 \end{array}$$

\INTEGERQUOTIENT{435}{27}{\sol}  
\sol

\INTEGERQUOTIENT{27}{435}{\sol}  
\sol

\INTEGERQUOTIENT{-43.5}{2.7}{\sol}  
\sol

\MODULO{\langle num1 \rangle}{\langle num2 \rangle}{\langle \cmd \rangle} Remainder of the integer division of *num1* and *num2*.

Ex. 21

$$\begin{aligned} 435 &\equiv 3 \pmod{27} \\ -435 &\equiv 24 \pmod{27} \end{aligned}$$

\MODULO{435}{27}{\sol}  
\[  
435 \equiv \sol \pmod{27}  
\]  
\MODULO{-435}{27}{\sol}  
\[  
-435 \equiv \sol \pmod{27}  
\]

### 3.3.2 Greatest common divisor and least common multiple

\GCD{\langle num1 \rangle}{\langle num2 \rangle}{\langle \cmd \rangle} Greatest common divisor of the integers *num1* and *num2*.

Ex. 22

$$\gcd(435, 27) = 3$$

\GCD{435}{27}{\sol}  
\$\gcd(435, 27) = \sol\$

\LCM{\langle num1 \rangle}{\langle num2 \rangle}{\langle \cmd \rangle} Least common multiple of *num1* and *num2*.

Ex. 23

$$\text{lcm}(435, 27) = 3915$$

\newcommand{\lcm}{\operatorname{lcm}}  
\LCM{435}{27}{\sol}  
\$\lcm(435, 27) = \sol\$

### 3.3.3 Simplifying fractions

\FRACTIONSIMPLIFY{\langle num1 \rangle}{\langle num2 \rangle}{\langle \cmd1 \rangle}{\langle \cmd2 \rangle} stores in the \cmd1 and \cmd2 commands the numerator and denominator of the irreducible fraction equivalent to *num1*/*num2*.

Ex. 24

$$435/27 = 145/9$$

\FRACTIONSIMPLIFY{435}{27}{\sola}{\solb}  
\$435/27 = \sola/\solb\$

## 3.4 Elementary functions

### 3.4.1 Square roots

\SQUAREROOT {*num*}{{\cmd}} Square root of the number *num*.

Ex. 25

\SQUAREROOT{1.44}{\sol}  
\$\sqrt{1.44}=\sol\$

$$\sqrt{1.44} = 1.2$$

If the argument *num* is negative, the package returns a warning message.

Instead of \SQUAREROOT, you can use the alias \SQRT.

### 3.4.2 Exponential and logarithm

The \EXP and \LOG commands compute, by default, exponentials and logarithms of the natural base e. They admit, however, an optional argument to choose another base.

\EXP {*num*}{{\cmd}} Exponential of the number *num*.

Ex. 26

\EXP{0.5}{\sol}  
\$\exp(0.5)=\sol\$

$$\exp(0.5) = 1.64871$$

The argument *num* must be in the interval  $[-9.704, 9.704]$ . <sup>9</sup>

Moreover, the \EXP command accepts an optional argument, to compute expressions such as  $a^x$ :

\EXP [{*num1*}]{*num2*}{{\cmd}} Exponential with base *num1* of *num2*. *num1* must be a positive number.

Ex. 27

\EXP[10]{1.3}{\sol}  
\$10^{1.3}=\sol\$

$$10^{1.3} = 19.95209$$

$$2^{1/3} = 1.25989$$

\EXP[2]{0.33333}{\sol}  
\$2^{0.33333}=\sol\$

\LOG {*num*}{{\cmd}} logarithm of the number *num*.

Ex. 28

\LOG{0.5}{\sol}  
\$\log 0.5=\sol\$

$$\log 0.5 = -0.69315$$

---

<sup>9</sup>9.704 is the logarithm of 16383, the largest number that supports the TeX's arithmetic.

`\LOG [num1] {num2} {\cmd}` Logarithm in base *num1* of *num2*.

Ex. 29

```
\LOG[10]{0.5}{\sol}
$\log_{10} 0.5=\sol$
```

$$\log_{10} 0.5 = -0.30103$$

### 3.4.3 Trigonometric functions

The arguments, in functions `\SIN`, `\COS`, ..., are measured in radians. If you measure angles in degrees (sexagesimal or not), use the `\DEGREESSIN`, `\DEGREESCOS`, ... commands.

`\SIN {num} {\cmd}` Sine of *num*.

`\COS {num} {\cmd}` Cosine of *num*.

`\TAN {num} {\cmd}` Tangent of *num*.

`\COT {num} {\cmd}` Cotangent of *num*.

Ex. 30

```
\SIN{\numberTHIRDPi}{\sol}
$\sin \pi/3=\sol$
```

$$\sin \pi/3 = 0.86601$$

$$\cos \pi/3 = 0.5$$

$$\tan \pi/3 = 1.73201$$

$$\cot \pi/3 = 0.57736$$

```
\COS{\numberTHIRDPi}{\sol}
$\cos \pi/3=\sol$
```

```
\TAN{\numberTHIRDPi}{\sol}
$\tan \pi/3=\sol$
```

```
\COT{\numberTHIRDPi}{\sol}
$\cot \pi/3=\sol$
```

`\DEGREESSIN {num} {\cmd}` Sine of *num* sexagesimal degrees.

`\DEGREESCOS {num} {\cmd}` Cosine of *num* sexagesimal degrees.

`\DEGREESTAN {num} {\cmd}` Tangent of *num* sexagesimal degrees.

`\DEGREESCOT {num} {\cmd}` Cotangent of *num* sexagesimal degrees.

Ex. 31

```
\DEGREESSIN{60}{\sol}
$\sin 60^{\circ}=\sol$
```

$$\sin 60^{\circ} = 0.86601$$

$$\cos 60^{\circ} = 0.49998$$

$$\tan 60^{\circ} = 1.73201$$

$$\cot 60^{\circ} = 0.57736$$

```
\DEGREESCOS{60}{\sol}
$\cos 60^{\circ}=\sol$
```

```
\DEGREESTAN{60}{\sol}
$\tan 60^{\circ}=\sol$
```

```
\DEGREESCOT{60}{\sol}
$\cot 60^{\circ}=\sol$
```

The latter commands support an optional argument that allows us to divide the circle in an arbitrary number of *degrees* (not necessarily 360).

```
\DEGREESSIN [(degrees)]{(num)}{(cmd)}
\DEGREESCOS [(degrees)]{(num)}{(cmd)}
\DEGREESTAN [(degrees)]{(num)}{(cmd)}
\DEGREESCOT [(degrees)]{(num)}{(cmd)}
```

By example, `\DEGREESCOS[400]{50}` computes the cosine of 50 gradians (a right angle has 100 gradians, the whole circle has 400 gradians), which are equivalent to 45 (sexagesimal) degrees or  $\pi/4$  radians. Or to 1 *degree*, if we divide the circle into 8 parts!

**Ex. 32**

0.70709  
0.70709  
0.7071  
0.70709

```
\DEGREESCOS[400]{50}{\sol}
\sol
\DEGREESCOS{45}{\sol}
\sol
\cos{\numberQUARTERPI}{\sol}
\sol
\DEGREESCOS[8]{1}{\sol}
\sol
```

Moreover, we have a couple of commands to convert between radians and degrees,

`\DEGtoRAD {(num)}{(cmd)}` Equivalence in radians of *num* sexagesimal degrees.

`\RADtoDEG {(num)}{(cmd)}` Equivalence in sexagesimal degrees of *num* radians.

**Ex. 33**

1.0472

```
\DEGtoRAD{60}{\sol}
\sol
```

and two other commands to reduce arguments to basic intervals:

`\REDUCERADIANSANGLE {(num)}{(cmd)}` Reduces the arc *num* to the interval  $]-\pi, \pi]$ .

`\REDUCEDEGREESANGLE {(num)}{(cmd)}` Reduces the angle *num* to the interval  $]-180, 180]$ .

**Ex. 34**

3.14159  
90

```
\MULTIPLY{\numberTWOPI}{10}{\TWENTYPI}
\ADD{\numberPI}{\TWENTYPI}{\TWENTYONEPI}
\REDUCERADIANSANGLE{\TWENTYONEPI}{\sol}
\sol
\REDUCEDEGREESANGLE{3690}{\sol}
\sol
```

### 3.4.4 Hyperbolic functions

`\SINH {⟨num⟩}{⟨\cmd⟩}` stores in `\cmd` the hyperbolic sine of `num`.

`\COSH {⟨num⟩}{⟨\cmd⟩}` Hyperbolic cosine of `num`.

`\TANH {⟨num⟩}{⟨\cmd⟩}` Hyperbolic tangent of `num`.

`\COTH {⟨num⟩}{⟨\cmd⟩}` Hyperbolic cotangent of `num`.

Ex. 35

1.61328  
1.89807  
0.84995  
1.17651

`\SINH{1.256}{\sol}`  
`\sol`  
`\COSH{1.256}{\sol}`  
`\sol`  
`\TANH{1.256}{\sol}`  
`\sol`  
`\COTH{1.256}{\sol}`  
`\sol`

### 3.4.5 Inverse trigonometric functions (new in version 2.0)

`\ARCSIN {⟨num⟩}{⟨\cmd⟩}` stores in `\cmd` the arcsin (inverse of sine) of `num`.

`\ARCCOS {⟨num⟩}{⟨\cmd⟩}` arccos of `num`.

`\ARCTAN {⟨num⟩}{⟨\cmd⟩}` arctan of `num`.

`\ARCCOT {⟨num⟩}{⟨\cmd⟩}` arccot of `num`.

Ex. 36

0.5236  
1.04718  
1.04718  
2.35619

`\ARCSIN{0.5}{\sol}`  
`\sol`  
`\ARCCOS{0.5}{\sol}`  
`\sol`  
`\ARCTAN{\numberSQRTHREE}{\sol}`  
`\sol`  
`\ARCCOT{-1}{\sol}`  
`\sol`

### 3.4.6 Inverse hyperbolic functions (new in version 2.0)

`\ARSINH {⟨num⟩}{⟨\cmd⟩}` stores in `\cmd` the arsinh (inverse of hyperbolic sine) of `num`.

`\ARCOSH {⟨num⟩}{⟨\cmd⟩}` arcosh of `num`.

`\ARTANH {⟨num⟩}{⟨\cmd⟩}` artanh of `num`.

```
\ARCOTH{\langle num \rangle}{\langle \cmd \rangle} arcoth of num.
```

Ex. 37

```
0.88138  
0  
0.5493  
0.5493
```

```
\ARSINH{1}{\sol}  
\sol  
\ARCOSH{1}{\sol}  
\sol  
\ARTANH{0.5}{\sol}  
\sol  
\ARCOTH{2}{\sol}  
\sol
```

## 4 Operations with lengths

```
\LENGTHDIVIDE{\langle length1 \rangle}{\langle length2 \rangle}{\langle \cmd \rangle}
```

This command divides two lengths and returns a number.

Ex. 38

One inch equals 2.54 centimeters.

```
\LENGTHDIVIDE{1in}{1cm}{\sol}  
One inch equals \$\sol$ centimeters.
```

```
\LENGTHADD{\langle length1 \rangle}{\langle length2 \rangle}{\langle \cmd \rangle}
```

```
\LENGTHSUBTRACT{\langle length1 \rangle}{\langle length2 \rangle}{\langle \cmd \rangle}
```

(\cmd must be a predefined length).

Ex. 39

```
1in + 1cm = 100.72273pt.  
1in - 1cm = 43.81725pt.
```

```
\newlength{\mylength}  
\LENGTHADD{1in}{1cm}{\mylength}  
$1in+1cm=\the\mylength$.  
  
\LENGTHSUBTRACT{1in}{1cm}{\mylength}  
$1in-1cm=\the\mylength$.
```

## 5 Matrix arithmetic

The calculator package defines the commands described below to operate on vectors and matrices. We only work with two or three-dimensional vectors and  $2 \times 2$  and  $3 \times 3$  matrices. Vectors are represented in the form  $(a_1, a_2)$  or  $(a_1, a_2, a_3)$ <sup>10</sup> and, in the case of matrices, columns are separated à la matlab by semicolons:  $(a_{11}, a_{12}; a_{21}, a_{22})$  or  $(a_{11}, a_{12}, a_{13}; a_{21}, a_{22}, a_{23}; a_{31}, a_{32}, a_{33})$ .

---

<sup>10</sup>But they are *column* vectors.

## 5.1 Vector operations

### 5.1.1 Assignments

\VECTORCOPY( $\langle x, y \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2 \rangle$ ) copy the entries of vector  $(x, y)$  to the  $\backslash cmd1$  and  $\backslash cmd2$  commands.

\VECTORCOPY( $\langle x, y, z \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2, \backslash cmd3 \rangle$ ) copy the entries of vector  $(x, y, z)$  to the  $\backslash cmd1$ ,  $\backslash cmd2$  and  $\backslash cmd3$  commands.

Ex. 40

$$\begin{aligned} & (1, -1) \\ & (1, -1, 2) \end{aligned}$$

```
\VECTORCOPY(1,-1)(\sola,\solb)
$(\sola,\solb)$

\VECTORCOPY(1,-1,2)(\sola,\solb,\solc)
$(\sola,\solb,\solc)$
```

### 5.1.2 Vector addition and subtraction

\VECTORADD( $\langle x_1, y_1 \rangle$ ) ( $\langle x_2, y_2 \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2 \rangle$ )

\VECTORADD( $\langle x_1, y_1, z_1 \rangle$ ) ( $\langle x_2, y_2, z_2 \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2, \backslash cmd3 \rangle$ )

\VECTORSUB( $\langle x_1, y_1 \rangle$ ) ( $\langle x_2, y_2 \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2 \rangle$ )

\VECTORSUB( $\langle x_1, y_1, z_1 \rangle$ ) ( $\langle x_2, y_2, z_2 \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2, \backslash cmd3 \rangle$ )

Ex. 41

$$\begin{aligned} & (1, -1, 2) + (3, 5, -1) = (4, 4, 1) \\ & (1, -1, 2) - (3, 5, -1) = (-2, -6, 3) \end{aligned}$$

```
\VECTORADD(1,-1,2)(3,5,-1)(\sola,\solb,\solc)
$(1,-1,2)+(3,5,-1)=(\sola,\solb,\solc)$

\VECTORSUB(1,-1,2)(3,5,-1)(\sola,\solb,\solc)
$(1,-1,2)-(3,5,-1)=(\sola,\solb,\solc)$
```

### 5.1.3 Scalar-vector product

\SCALARVECTORPRODUCT{ $\langle num \rangle$ }( $\langle x, y \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2 \rangle$ )

\SCALARVECTORPRODUCT{ $\langle num \rangle$ }( $\langle x, y, z \rangle$ ) ( $\langle \backslash cmd1, \backslash cmd2, \backslash cmd3 \rangle$ )

Ex. 42

$$\begin{aligned} & 2(3, 5) = (6, 10) \\ & 2(3, 5, -1) = (6, 10, -2) \end{aligned}$$

```
\SCALARVECTORPRODUCT{2}(3,5)(\sola,\solb)
$2(3,5)=(\sola,\solb)$

\SCALARVECTORPRODUCT{2}(3,5,-1)(%
\sola,\solb,\solc)
$2(3,5,-1)=(\sola,\solb,\solc)$
```

#### 5.1.4 Scalar (dot) product and euclidean norm

```
\SCALARPRODUCT(<x1,y1>)(<x2,y2>){<\cmd>}
\SCALARPRODUCT(<x1,y1,z1>)(<x2,y2,z2>){<\cmd>}
\DOTPRODUCT is an alias of \SCALARPRODUCT (new in version 2.0).
\VECTORNORM(<x,y>){<\cmd>}
\VECTORNORM(<x,y,z>){<\cmd>}
```

Ex. 43

$$\begin{aligned} (1, -1) \cdot (3, 5) &= -2 \\ (1, -1, 2) \cdot (3, 5, -1) &= -4 \\ \|(3, 4)\| &= 5 \\ \|(1, 2, -2)\| &= 3 \end{aligned}$$

$$\begin{aligned} \SCALARPRODUCT(1,-1)(3,5){\sol} \\ $(1,-1)\cdot(3,5)=\sol$ \\ \DOTPRODUCT(1,-1,2)(3,5,-1){\sol} \\ $(1,-1,2)\cdot(3,5,-1)=\sol$ \\ \VECTORNORM(3,4){\sol} \\ $\left\|(3,4)\right\|=\sol$ \\ \VECTORNORM(1,2,-2){\sol} \\ $\left\|(1,2,-2)\right\|=\sol$ \end{aligned}$$

#### 5.1.5 Vector (cross) product (*new in version 2.0*)

```
\VECTORPRODUCT(<x1,y1,z1>)(<x2,y2,z2>)(<\cmd1,>,\cmd2,\cmd3>)
```

\CROSSPRODUCT is an alias of \VECTORPRODUCT.

Ex. 44

$$\begin{aligned} (1, -1, 2) \times (3, 5, -1) &= (-9, 7, 8) \\ (1, -1, 2) \times (-3, 3, -6) &= (0, 0, 0) \end{aligned}$$

$$\begin{aligned} \CROSSPRODUCT(1,-1,2)(3,5,-1)% \\ (\sola,\solb,\solc) \\ $(1,-1,2)\times(3,5,-1)=(\sola,\solb,\solc)$ \\ \VECTORPRODUCT(1,-1,2)(-3,3,-6)% \\ (\sola,\solb,\solc) \\ $(1,-1,2)\times(-3,3,-6)=(\sola,\solb,\solc)$ \end{aligned}$$

#### 5.1.6 Unit vector parallel to a given vector (normalized vector)

```
\UNITVECTOR(<x,y>)(<\cmd1,\cmd2>)
\UNITVECTOR(<x,y,z>)(<\cmd1,\cmd2,\cmd3>)
```

Ex. 45

$$\begin{aligned} (0.59999, 0.79999) \\ (0.33333, 0.66666, -0.66666) \end{aligned}$$

$$\begin{aligned} \UNITVECTOR(3,4)(\sola,\solb) \\ $(\sola,\solb)$ \\ \UNITVECTOR(1,2,-2)(\sola,\solb,\solc) \\ $(\sola,\solb,\solc)$ \end{aligned}$$

### 5.1.7 Absolute value (in each entry of a given vector)

```
\VECTORABSV((x,y))(<\cmd1,\cmd2>)
\VECTORABSV((x,y,z))(<\cmd1,\cmd2,\cmd3>)
```

Ex. 46

$$\begin{pmatrix} 3, 4 \\ 3, 4, 1 \end{pmatrix}$$

```
\VECTORABSV(3,-4)(\sola,\solb)
$(\sola,\solb)$
\VECTORABSV(3,-4,-1)(\sola,\solb,\solc)
$(\sola,\solb,\solc)$
```

### 5.1.8 Angle between two vectors (new in version 2.0)

```
\TWOVECTORSANGLE((x1,y1))((x2,y2)){<\cmd>}
\TWOVECTORSANGLE((x1,y1,z1))((x2,y2,z2)){<\cmd>}
```

Ex. 47

$$\begin{aligned} &0.78537 \text{ radians (or } 44.99837 \text{ degrees)} \\ &1.57079 \text{ (or } 89.99937 \text{ degrees)} \end{aligned}$$

```
\TWOVECTORSANGLE(1,1)(0,1){\sol}
$\sol$ radians
\RADtoDEG{\sol}{\degso}
(or $\degso$ degrees)

\TWOVECTORSANGLE(1,0,0)(0,1,0){\sol}
$\sol$ radians
\RADtoDEG{\sol}{\degso}
(or $\degso$ degrees)
```

## 5.2 Matrix operations

### 5.2.1 Assignments

```
\MATRIXCOPY ((a11,a12;a21,a22)) (<\cmd11,\cmd12;\cmd21,\cmd22>)
```

Use this command to store the matrix  $\begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$  in  $\cmm11, \cmm12, \cmm21, \cmm22$ .

The analogous  $3 \times 3$  version is

```
\MATRIXCOPY ((a11,a12,a13; [...] ,a33)) (<\cmd11,\cmd12,\cmd13; [...] ,\cmd33>)
```

Ex. 48

$$\begin{bmatrix} 1 & -1 & 2 \\ 3 & 0 & 5 \\ -1 & 1 & 4 \end{bmatrix}$$

```
\MATRIXCOPY(1, -1, 2;
            3, 0, 5;
            -1, 1, 4)%
(\sola,\solb,\solc;
 \sold,\sole,\solf;
 \solg,\solh,\soli)
\$begin{bmatrix}
\sola & \solb & \solc \\
\sold & \sole & \solf \\
\solg & \solh & \soli
\end{bmatrix}$
\end{bmatrix}
```

Henceforth, we will present only the syntax for commands operating with  $2 \times 2$  matrices. In all cases, the syntax is similar if we work with  $3 \times 3$  matrices. In the examples, we will work with either  $2 \times 2$  or  $3 \times 3$  matrices.

### 5.2.2 Transposed matrix

\TRANSPOSEMATRIX ( $a_{11}, a_{12}; a_{21}, a_{22}$ ) ( $\backslash cmd{11}, \backslash cmd{12}; \backslash cmd{21}, \backslash cmd{22}$ )

Ex. 49

$$\begin{bmatrix} 1 & -1 \\ 3 & 0 \end{bmatrix}^T = \begin{bmatrix} 1 & 3 \\ -1 & 0 \end{bmatrix}$$

```
\TRANSPOSEMATRIX(1,-1;3,0)%
(\sola,\solb;\solc,\sold)
$\begin{bmatrix}
1 & -1 \\
3 & 0
\end{bmatrix}^T=\begin{bmatrix}
1 & 3 \\
-1 & 0
\end{bmatrix}%
\sola & \solb \\\solc & \sold
\end{bmatrix}$
```

### 5.2.3 Matrix addition and subtraction

\MATRIXADD ( $a_{11}, a_{12}; a_{21}, a_{22}$ ) ( $b_{11}, b_{12}; b_{21}, b_{22}$ ) ( $\backslash cmd{11}, \backslash cmd{12}; \backslash cmd{21}, \backslash cmd{22}$ )

\MATRIXSUB ( $a_{11}, a_{12}; a_{21}, a_{22}$ ) ( $b_{11}, b_{12}; b_{21}, b_{22}$ ) ( $\backslash cmd{11}, \backslash cmd{12}; \backslash cmd{21}, \backslash cmd{22}$ )

Ex. 50

$$\begin{bmatrix} 1 & -1 \\ 3 & 0 \end{bmatrix} + \begin{bmatrix} 3 & 5 \\ -3 & 2 \end{bmatrix} = \begin{bmatrix} 4 & 4 \\ 0 & 2 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -1 \\ 3 & 0 \end{bmatrix} - \begin{bmatrix} 3 & 5 \\ -3 & 2 \end{bmatrix} = \begin{bmatrix} -2 & -6 \\ 6 & -2 \end{bmatrix}$$

```
\MATRIXADD(1,-1;3,0)(3,5;-3,2)%
(\sola,\solb;\solc,\sold)
$\begin{bmatrix}
1 & -1 \\
3 & 0
\end{bmatrix}+%
\begin{bmatrix}
3 & 5 \\
-3 & 2
\end{bmatrix}=%
\begin{bmatrix}
4 & 4 \\
0 & 2
\end{bmatrix}%
\sola & \solb \\\solc & \sold
\end{bmatrix}$
```

```
\MATRIXSUB(1,-1;3,0)(3,5;-3,2)%
(\sola,\solb;\solc,\sold)
$\begin{bmatrix}
1 & -1 \\
3 & 0
\end{bmatrix}-%
\begin{bmatrix}
3 & 5 \\
-3 & 2
\end{bmatrix}=%
\begin{bmatrix}
-2 & -6 \\
6 & -2
\end{bmatrix}%
\sola & \solb \\\solc & \sold
\end{bmatrix}$
```

#### 5.2.4 Scalar-matrix product

\SCALAR MATRIX PRODUCT { $\langle num \rangle$ } ( $\langle a_{11}, a_{12}; a_{21}, a_{22} \rangle$ ) ( $\langle \backslash cmd{11}, \backslash cmd{12}; \backslash cmd{21}, \backslash cmd{22} \rangle$ )

Ex. 51

$$3 \begin{bmatrix} 1 & -1 & 2 \\ 3 & 0 & 5 \\ -1 & 1 & 4 \end{bmatrix} = \begin{bmatrix} 3 & -3 & 6 \\ 9 & 0 & 15 \\ -3 & 3 & 12 \end{bmatrix}$$

```
\SCALAR MATRIX PRODUCT{3}{1,-1,2;
3, 0,5;
-1, 1,4}%
(\sola,\solb,\solc;
\sold,\sole,\solf;
\solg,\solh,\solj)
$3\begin{bmatrix}
1 & -1 & 2 \\
3 & 0 & 5 \\
-1 & 1 & 4
\end{bmatrix}%
=\begin{bmatrix}
\sola & \solb & \solc \\
\sold & \sole & \solf \\
\solg & \solh & \solj
\end{bmatrix}$
\end{bmatrix}
```

#### 5.2.5 Matriu-vector product

\MATRIXVECTOR PRODUCT ( $\langle a_{11}, a_{12}; a_{21}, a_{22} \rangle$ ) ( $\langle x, y \rangle$ ) ( $\langle \backslash cmd{1}, \backslash cmd{2} \rangle$ )

Ex. 52

$$\begin{bmatrix} 1 & -1 \\ 0 & 2 \end{bmatrix} \begin{bmatrix} 3 \\ 5 \end{bmatrix} = \begin{bmatrix} -2 \\ 10 \end{bmatrix}$$

```
\MATRIXVECTOR PRODUCT(1,-1;
0, 2)(3,5)(\sola,\solb)
$ \begin{bmatrix}
1 & -1 \\
0 & 2
\end{bmatrix} \begin{bmatrix}
3 \\
5
\end{bmatrix}%
=\begin{bmatrix}
\sola & \solb
\end{bmatrix}$
\end{bmatrix}
```

#### 5.2.6 Product of two square matrices

\MATRIX PRODUCT ( $\langle a_{11}, a_{12}; a_{21}, a_{22} \rangle$ ) ( $\langle b_{11}, b_{12}; b_{21}, b_{22} \rangle$ ) ( $\langle \backslash cmd{11}, \backslash cmd{12}; \backslash cmd{21}, \backslash cmd{22} \rangle$ )

Ex. 53

$$\begin{bmatrix} 1 & -1 & 2 \\ 3 & 0 & 5 \\ -1 & 1 & 4 \end{bmatrix} \begin{bmatrix} 3 & 5 & -1 \\ -3 & 2 & -5 \\ 1 & -2 & 3 \end{bmatrix} = \begin{bmatrix} 8 & -1 & 10 \\ 14 & 5 & 12 \\ -2 & -11 & 8 \end{bmatrix}$$

```
\MATRIXPRODUCT(1,-1,2;3,0,5;-1,1,4)%
(3,5,-1;-3,2,-5;1,-2,3)%
(\sola,\solb,\solc;
\sold,\sole,\sof;
\solg,\solh,\solj)
\begin{multiline*}
\begin{bmatrix}
1 & -1 & 2 \\
3 & 0 & 5 \\
-1 & 1 & 4
\end{bmatrix}
\begin{bmatrix}
3 & 5 & -1 \\
-3 & 2 & -5 \\
1 & -2 & 3
\end{bmatrix}
= \begin{bmatrix}
8 & -1 & 10 \\
14 & 5 & 12 \\
-2 & -11 & 8
\end{bmatrix}
\end{multiline*}
```

### 5.2.7 Determinant

\DETERMINANT ( $\langle a_{11}, a_{12}; a_{21}, a_{22} \rangle$ ) { $\langle \cmd \rangle$ }

Ex. 54

$$\begin{vmatrix} 1 & -1 & 2 \\ 3 & 0 & 5 \\ -1 & 1 & 4 \end{vmatrix} = 18$$

```
\DETERMINANT(1,-1,2;3,0,5;-1,1,4){\sol}
\SpecialUsageIndex{\DETERMINANT}%
\begin{vmatrix}
1 & -1 & 2 \\
3 & 0 & 5 \\
-1 & 1 & 4
\end{vmatrix}=\sol$
```

### 5.2.8 Inverse matrix

\INVERSEMATRIX ( $\langle a_{11}, a_{12}; a_{21}, a_{22} \rangle$ ) ( $\langle \cmd{11}, \cmd{12}; \cmd{21}, \cmd{22} \rangle$ )

Ex. 55

$$\begin{bmatrix} 1 & -1 \\ 3 & 5 \end{bmatrix}^{-1} = \begin{bmatrix} 0.625 & 0.125 \\ -0.375 & 0.125 \end{bmatrix}$$

```
\INVERSEMATRIX(1,-1;3,5)%
\sola,\solb;\solc,\sold%
\begin{bmatrix}
1 & -1 \\
3 & 5
\end{bmatrix}^{-1}=%
\begin{bmatrix}
\sola & \solb \\
\solc & \sold
\end{bmatrix}$
```

If the given matrix is singular, the `calculator` package returns a warning message and the `\cmd{11}, ..., \cmd{22}` commands are marqued as undefined.

### 5.2.9 Absolute value (in each entry)

\MATRIXABSVVALUE ( $a_{11}, a_{12}; a_{21}, a_{22}$ ) ( $\cmd{1}, \cmd{2}; \cmd{21}, \cmd{22}$ )

Ex. 56

$$\begin{bmatrix} 1 & 1 & 2 \\ 3 & 0 & 5 \\ 1 & 1 & 4 \end{bmatrix}$$

```
\MATRIXABSVVALUE(1,-1,2;3,0,5;-1,1,4)%
(\sola,\solb,\solc;
\sold,\sole,\solf;
\solg,\solh,\soli)
\$\begin{bmatrix}
\sola & \solb & \solc \\
\sold & \sole & \solf \\
\solg & \solh & \soli
\end{bmatrix}\$
```

### 5.2.10 Solving a linear system

\SOLVELINEARSYSTEM ( $a_{11}, a_{12}; a_{21}, a_{22}$ ) ( $b_1, b_2$ ) ( $\cmd{1}, \cmd{2}$ ) solves the linear system  $\begin{pmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} b_1 \\ b_2 \end{pmatrix}$  and stores the solution in ( $\cmd{1}, \cmd{2}$ ).

Ex. 57

Solving the linear system

$$\begin{bmatrix} 1 & -1 & 2 \\ 3 & 0 & 5 \\ -1 & 1 & 4 \end{bmatrix} X = \begin{bmatrix} -4 \\ 4 \\ -2 \end{bmatrix}$$

we obtain  $X = \begin{bmatrix} 3 \\ 5 \\ -1 \end{bmatrix}$

```
\SOLVELINEARSYSTEM(1,-1,2;3,0,5;-1,1,4)%
(-4,4,-2)%
(\sola,\solb,\solc)
Solving the linear system
\[
\begin{bmatrix}
1 & -1 & 2 \\
3 & 0 & 5 \\
-1 & 1 & 4
\end{bmatrix} \mathsf{X} = \begin{bmatrix}
-4 \\
4 \\
-2
\end{bmatrix}
\]
we obtain
$\mathsf{X} = \begin{bmatrix}
\sola \\
\solb \\
\solc
\end{bmatrix}\$
```

If the given matrix is singular, the package `calculator` returns a warning message. When system is indeterminate, in the bi-dimensional case one of the solutions is computed; if the system is incompatible, then the `\sola, ...`, commands are marqued as undefined. For three equations systems, only determinate systems are solved.<sup>11</sup>

---

<sup>11</sup>This is the only command that does not behave the same way with  $2 \times 2$  and  $3 \times 3$  matrices.

## Part II

# The calculus package

### 6 What is a *function*?

From the point of view of this package, a *function*  $f$  is a pair of formulae: the first one calculates  $f(t)$ ; the other,  $f'(t)$ . Therefore, any function is applied using three arguments: the value of the variable  $t$ , and two command names where  $f(t)$  and  $f'(t)$  will be stored. For example,

```
\SQUAREfunction{<num>}{<\sol>}{{<\Dsol>}}
```

computes  $f(t) = t^2$  and  $f'(t) = 2t$  (where  $t = \text{num}$ ), and stores the results in the commands  $\sol$  and  $\Dsol$ .<sup>12</sup>

Ex. 58

If  $f(t) = t^2$ , then

$$f(3) = 9 \text{ and } f'(3) = 6$$

```
\SQUAREfunction{3}{\sol}{\Dsol}
If \$f(t)=t^2$, then
\[
f(3)=\sol \ \mbox{ and } f'(3)=\Dsol
\]
```

For all functions defined here, you must use the following syntax:

```
\functionname{<num>}{{<\cmd1>}}{{<\cmd2>}}
```

being  $\text{num}$  a number (or a command whose value is a number), and  $\cmd1$  and  $\cmd2$  two control sequence names where the values of the function and its derivative (in this number) will be stored.

The key difference between this *functions* and the instructions defined in the calculator package is the inclusion of the derivative; for example, the `\SQUARE{3}{\sol}` instruction computes, only, the square power of number 3, while `\SQUAREfunction{3}{\sol}{\Dsol}` finds, also, the corresponding derivative.

### 7 Predefined functions

The calculus package predefines the most commonly used elementary functions, and includes several utilities for defining new ones. The predefined functions are the following:

<sup>12</sup>Do not spect any control about the existence or differentiability of the function; if the function or the derivative are not well defined, a TeX error will occur.

\ZEROfunction	$f(t) = 0$	\ONEfunction	$f(t) = 1$
\IDENTITYfunction	$f(t) = t$	\RECIPROCALfunction	$f(t) = 1/t$
\SQUAREfunction	$f(t) = t^2$	\CUBEfunction	$f(t) = t^3$
\SQRTfunction	$f(t) = \sqrt{t}$		
\EXPfunction	$f(t) = \exp t$	\LOGfunction	$f(t) = \log t$
\COSfunction	$f(t) = \cos t$	\SINfunction	$f(t) = \sin t$
\TANfunction	$f(t) = \tan t$	\COTfunction	$f(t) = \cot t$
\COSHfunction	$f(t) = \cosh t$	\SINHfunction	$f(t) = \sinh t$
\TANHfunction	$f(t) = \tanh t$	\COTHfunction	$f(t) = \coth t$
\HEAVISIDEfunction	$f(t) = \begin{cases} 0 & \text{si } t < 0 \\ 1 & \text{si } t \geq 0 \end{cases}$		

The following functions are added in version 2.0 (*new in version 2.0*)

\ARCCOSfunction	$f(t) = \arccos t$	\ARCSINfunction	$f(t) = \arcsin t$
\ARCTANfunction	$f(t) = \arctan t$	\ARCCOTfunction	$f(t) = \operatorname{arccot} t$
\ARCOSHfunction	$f(t) = \operatorname{arcosh} t$	\ARSINHfunction	$f(t) = \operatorname{arsinh} t$
\ARTANHfunction	$f(t) = \operatorname{artanh} t$	\ARCOTHfunction	$f(t) = \operatorname{arcoth} t$

In the following example, we use the \LOGfunction function to compute a table of the log function and its derivative.

Ex. 59

$x$	$\log x$	$\log' x$
1	0	1
2	0.69315	0.5
3	1.0986	0.33333
4	1.38629	0.25
5	1.60942	0.2
6	1.79176	0.16666

```
$\begin{array}{ll}
x & \log x & \log' x \\
1 & 0 & 1 \\
2 & 0.69315 & 0.5 \\
3 & 1.0986 & 0.33333 \\
4 & 1.38629 & 0.25 \\
5 & 1.60942 & 0.2 \\
6 & 1.79176 & 0.16666
\end{array}$
```

## 8 Operations with functions

We can define new functions using the following *operations* (the last argument is the name of the new function):

\CONSTANTfunction{\langle num \rangle}{\langle Function \rangle} defines *Function* as the constant function *num*.

Example. Definition of the  $F(t) = 5$  function:

\CONSTANTfunction{5}{F}

\SUMfunction{\langle function1 \rangle}{\langle function2 \rangle} {\langle Function \rangle} defines *Function* as the sum of functions *function1* and *function2*.  
Example. Definition of the  $F(t) = t^2 + t^3$  function:  
\SUMfunction{\SQUAREfunction}{\CUBEfunction}{\F}

\SUBTRACTfunction{\langle function1 \rangle}{\langle function2 \rangle} {\langle Function \rangle} defines *Function* as the difference of functions *function1* and *function2*.  
Example. Definition of the  $F(t) = t^2 - t^3$  function:  
\SUBTRACTfunction{\SQUAREfunction}{\CUBEfunction}{\F}

\PRODUCTfunction{\langle function1 \rangle}{\langle function2 \rangle} {\langle Function \rangle} defines *Function* as the product of functions *function1* and *function2*  
Example. Definition of the  $F(t) = e^t \cos t$  function:  
\PRODUCTfunction{\EXPfunction}{\COSfunction}{\F}

\QUOTIENTfunction{\langle function1 \rangle}{\langle function2 \rangle} {\langle Function \rangle} defines *Function* as the quotient of functions *function1* and *function2*.  
Example. Definition of the  $F(t) = e^t / \cos t$  function:  
\QUOTIENTfunction{\EXPfunction}{\COSfunction}{\F}

\COMPOSITIONfunction{\langle function1 \rangle}{\langle function2 \rangle} {\langle Function \rangle} defines *Function* as the composition of functions *function1* and *function2*.  
Example. Definition of the  $F(t) = e^{\cos t}$  function:  
\COMPOSITIONfunction{\EXPfunction}{\COSfunction}{\F}  
(note than \COMPOSITIONfunction{f}{g}{\F} means  $f \circ g$ ).  
\SCALEfunction{\langle num \rangle}{\langle function \rangle} {\langle Function \rangle} defines *Function* as the product of number *num* and function *function*.  
Example. Definition of the  $F(t) = 3 \cos t$  function:  
\SCALEfunction{3}{\COSfunction}{\F}

\SCALEVARIABLEfunction{\langle num \rangle}{\langle function \rangle} {\langle Function \rangle} scales the variable by factor *num* and then applies the function *function*.  
Example. Definition of the  $F(t) = \cos 3t$  function:  
\SCALEVARIABLEfunction{3}{\COSfunction}{\F}

\POWERfunction{\langle function \rangle}{\langle num \rangle} {\langle Function \rangle} defines *Function* as the power of function *function* to the exponent *num* (a positive integer). Example. Definition of the  $F(t) = t^5$  function:  
\POWERfunction{\IDENTITYfunction}{5}{\F}

\LINEARCOMBINATIONfunction{\langle num1 \rangle}{\langle function1 \rangle} {\langle num2 \rangle}{\langle function2 \rangle}{\langle Function \rangle} defines *Function* as the linear combination of functions *function1* and *function2* multiplied, respectively, by numbers *num1* and *num2*.

Example. Definition of the  $F(t) = 2t - 3 \cos t$  function:

```
\LINEARCOMBINATIONfunction{2}{\IDENTITYfunction}{-3}{\COSfunction}{\F}
```

By combining properly this operations and the predefined functions, many elementary functions can be defined.

**Ex. 60**

If

$$f(t) = 3t^2 - 2e^{-t} \cos t$$

then

$$f(5) = 74.99619$$

$$f'(5) = 29.99084$$

```
% exp(-t)
\SCALEVARIABLEfunction
{-1}{\EXPfunction}
{\NEGEXPfunction}

% exp(-t)cos(t)
\PRODUCTfunction
{\NEGEXPfunction}
{\COSfunction}
{\NEGEXPCOSfunction}

% 3t^2-2exp(-t)cos(t)
\LINEARCOMBINATIONfunction
{3}{\SQUAREfunction}
{-2}{\NEGEXPCOSfunction}
{\myfunction}

\myfunction{5}{\sol}{\Dsol}

If
\[
f(t)=3t^2-2\mathbf{e}^{-t}\cos t
\]
then
\[
\begin{gathered}
f(5)=\sol \\
f'(5)=\Dsol
\end{gathered}
\]
```

## 9 Polynomial functions

Although polynomial functions can be defined using linear combinations of power functions, to facilitate our work, the `calculus` package includes the following commands to define more easily the polynomials of 1, 2, and 3 degrees: `\newlpoly` (new *linear* polynomial), `\newqpoly` (new *quadratic* polynomial), and `\newcpoly` (new *cubic* polynomial):

`\newlpoly{\langle Function \rangle}{\langle a \rangle}{\langle b \rangle}` stores the  $p(t) = a + bt$  function in the *Function* command.

`\newqpoly{\langle Function\rangle}{\langle a\rangle}{\langle b\rangle}{\langle c\rangle}` stores the  $p(t) = a + bt + ct^2$  function in the `\Function` command.

`\newcpoly{\langle Function\rangle}{\langle a\rangle}{\langle b\rangle}{\langle c\rangle}{\langle d\rangle}` stores the  $p(t) = a + bt + ct^2 + dt^3$  function in the `\Function` command.

Ex. 61

$$p'(2) = 8$$

```
% \mypoly=1-x^2+x^3
\newcpoly{\mypoly}{1}{0}{-1}{1}
\mypoly{2}{\sol}{\Dsol}
$p'(2)=\Dsol$
```

These declarations behave similarly to the declaration `\newcommand`: If the name you want to assign to the new function is that of an already defined command, the `calculus` package returns an error message and does not redefine this command. To obtain any alternative behavior, our package includes three other sets of declarations:

`\renewlpoly`, `\renewqpoly`, `\renewcpoly` redefine the already existing command `\Function`. If this command does not exist, then it is not defined and an error message occurs.

`\ensurelpoly`, `\ensureqpoly`, `\ensurecpoly` define a new function. If the command `\Function` already exists, it is not redefined.

`\forcelpoly`, `\forceqpoly`, `\forcecpoly` define a new function. If the command `\Function` already exists, it is redefined.

## 10 Vector-valued functions (or parametrically defined curves)

The instruction

`\PARAMETRICfunction{\langle Xfunction\rangle}{\langle Yfunction\rangle}{\langle myvectorfunction\rangle}`

defines the new vector-valued function  $f(t) = (x(t), y(t))$ .

The first and second arguments are a pair of functions already defined and, the third, the name of the new function we define. Once we have defined them, the new vector functions requires five arguments:

`\myvectorfunction{\langle num\rangle}{\langle cmd1\rangle}{\langle cmd2\rangle}{\langle cmd3\rangle}{\langle cmd4\rangle}`

where

- `num` is a number  $t$ ,
- `\cmd1` and `\cmd2` are two command names where the values of the  $x(t)$  function and its derivative  $x'(t)$  will be stored, and
- `\cmd3` and `\cmd4` will store  $y(t)$  and  $y'(t)$ .

In short, in this context, a vector function is a pair of scalar functions.

Instead of `\PARAMETRICfunction` we can use the alias `\VECTORfunction`.

**Ex. 62**

For the  $f(t) = (t^2, t^3)$  function we have

$$f(4) = (16, 64), f'(4) = (8, 48)$$

```
For the $f(t)=(t^2,t^3)$ function we have
\VECTORfunction
{\SQUAREfunction}{\CUBEfunction}{\F}
\{F\}{\solx}{\Dsolx}{\soly}{\Dsoly}
\[
f(4)=(\solx,\soly), f'(4)=(\Dsolx,\Dsoly)
\]
```

## 11 Vector-valued functions in polar coordinates

The following instruction:

```
\POLARfunction{\langle rfunction \rangle}{\langle Polarfunction \rangle}
```

declares the vector function  $f(\phi) = (r(\phi) \cos \phi, r(\phi) \sin \phi)$ . The first argument is the  $r = r(\phi)$  function, (an already defined function). For example, we can define the *Archimedean spiral*  $r(\phi) = 0.5\phi$ , as follows:

```
\SCALEfunction{0.5}{\IDENTITYfunction}{\rfunction}
\POLARfunction{\rfunction}{\archimedes}
```

## 12 Low-level instructions

Probably, many users of the package will not be interested in the implementation of the commands this package includes. If this is your case, you can ignore this section.

### 12.1 The `\newfunction` declaration and its variants

All the functions predefined by this package use the `\newfunction` declaration. This control sequence works as follows:

```
\newfunction{\langle Function \rangle}{\langle Instructions to compute \y and \Dy from \t \rangle}
```

where the second argument is the list of the instructions you need to run to calculate the value of the function `\y` and the derivative `\Dy` in the `\t` point.

For example, if you want to define the  $f(t) = t^2 + e^t \cos t$  function, whose derivative is  $f'(t) = 2t + e^t(\cos t - \sin t)$ , using the high-level instructions we defined earlier, you can write the following instructions:

```
\PRODUCTfunction{\EXPfunction}{\COSfunction}{\ffunction}
\SUMfunction{\SQUAREfunction}{\ffunction}{\Ffunction}
```

But you can also define this function using the `\newfunction` command as follows:

```

\newfunction{\Ffunction}{%
    \SQUARE{\t}{\tempA} % A=t^2
    \EXP{\t}{\tempB} % B=e^t
    \COS{\t}{\tempC} % C=cos(t)
    \SIN{\t}{\tempD} % D=sin(t)
    \MULTIPLY{2}{\t}{\tempE} % E=2t
    \MULTIPLY{\tempB}{\tempC}{\tempC} % C=e^t cos(t)
    \MULTIPLY{\tempB}{\tempD}{\tempD} % D=e^t sin(t)
    \ADD{\tempA}{\tempC}{\y} % y=t^2 + e^t cos(t)
    \ADD{\tempE}{\tempC}{\tempC} % C=t^2 + e^t cos(t)
    \SUBTRACT{\tempC}{\tempD}{\Dy} % y'=t^2 + e^t cos(t) - e^t sin(t)
}

```

It must be said, however, that the `\newfunction` declaration behaves similarly to `\newcommand` or `\newlpolynomial`: If the name you want to assign to the new function is that of an already defined command, the `calculus` package returns an error message and does not redefines this command. To obtain any alternative behavior, our package includes three other versions of the `\newfunction` declarations: the `\renewfunction`, `\ensurefunction` and `\forcefunction` declarations. Each of these declarations behaves differently:

`\newfunction` defines a new function. If the command `\Function` already exists, it is not redefined and an error message occurs.

`\renewfunction` redefines the already existing command `\Function`. If this command does not exists, then it is not defined and an error message occurs.

`\ensurefunction` defines a new function. If the command `\Function` already exists, it is not redefined.

`\forcefunction` defines a new function. If the command `\Function` already exists, it is redefined.

## 12.2 Vector functions and polar coordinates

You can (re)define a vector function  $f(t) = (x(t), y(t))$  using the `\newvectorfunction` declaration or any of its variants `\renewvectorfunction`, `\ensurevectorfunction` and `\forcevectorfunction`:

```
\newvectorfunction{<\Function>}{<Instructions to compute \x, \Dx, \y and \Dy from \t>}
```

For example, you can define the function  $f(t) = (t^2, t^3)$  in the following way:

```

\newvectorfunction{\F}{%
    \SQUARE{\t}{\x} % x=t^2
    \MULTIPLY{2}{\t}{\Dx} % x'=2t
    \CUBE{\t}{\y} % y=t^3
    \MULTIPLY{3}{\x}{\Dy} % y'=3t^2
}

```

Finally, to define the  $r = r(\phi)$  function, in polar coordinates, we have the declarations `\newpolarfunction`, `\renewpolarfunction`, `\ensurepolarfunction` and `\forcepolarfunction`.

`\newpolarfunction{<Function>}{<Instructions to compute \r and \Dr from \t>}`

For example, you can define the *cardioide* curve  $r(\phi) = 1 + \cos \phi$ , using high level instructions,

```
\SUMfunction{\ONEfunction}{\COSfunction}{\ffunction} % y=1 + cos t
\POLARfunction{\ffunction}{\cardioide}
```

or, with the `\newpolarfunction` declaration,

```
\newpolarfunction{\cardioide}{%
  \COS{\t}{\r}
  \ADD{1}{\r}{\r}           % r=1+cos t
  \SIN{\t}{\Dr}
  \MULTIPLY{-1}{\Dr}{\Dr} % r'=-sin t
}
```

## Part III

# Implementation

## 13 calculator

```
1 <calculator>
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{calculator}[2022/09/15 v.2.1]
```

### 13.1 Internal lengths and special numbers

`\cctr@lengtha` and `\cctr@lengthb` will be used in internal calculations and comparisons.

```
4 \newdimen\cctr@lengtha
5 \newdimen\cctr@lengthb
```

`\cctr@epsilon` `\cctr@epsilon` will store the closest to zero length in the TeX arithmetic: one scaled point ( $1 \text{sp} = 1/65536 \text{ pt}$ ). This means the smallest positive number will be  $0.00002 \approx 1/65536 = 1/2^{16}$ .

```
6 \newdimen\cctr@epsilon
7 \cctr@epsilon=1sp
```

`\cctr@logmaxnum` The largest TeX number is  $16383.99998 \approx 2^{14}$ ; `\cctr@logmaxnum` is the logarithm of this number,  $9.704 \approx \log 16384$ .

```
8 \def\cctr@logmaxnum{9.704}
```

## 13.2 Warning messages

```
9 \def\cctr@Warntruncate#1#2{%

### 13.3 Operations with numbers

#### Assignments and comparisons

\COPY \COPY{\#1}{\#2} defines the #2 command as the number #1.  
142 \def\COPY#1#2{\edef#2{\#1}\ignorespaces}

\GLOBALCOPY Global version of \COPY. The new defined command #2 is not changed outside groups.  
143 \def\GLOBALCOPY#1#2{\xdef#2{\#1}\ignorespaces}

\@OUTPUTSOL \@OUTPUTSOL{\#1}: an internal macro to save solutions when a group is closed.  
The global c.s. \cctr@outa preserves solutions. Whenever we use any temporary parameters in the definition of an instruction, we use a group to ensure the local character of those parameters. The instruction \@OUTPUTSOL is a bypass to export the solution.  
144 \def\@OUTPUTSOL#1{\GLOBALCOPY{\#1}{\cctr@outa}\endgroup\COPY{\cctr@outa}{\#1}}

\@OUTPUTSOLS Analogous to \@OUTPUTSOL, preserving a pair of solutions.

```

145 \def \@OUTPUTSOLS#1#2{\GLOBALCOPY{#1}{\cctr@outa}
146           \GLOBALCOPY{#2}{\cctr@outb}\endgroup
147           \COPY{\cctr@outa}{#1}\COPY{\cctr@outb}{#2}}

```

\MAX \MAX{\#1}{\#2}{\#3} defines the #3 command as the maximum of numbers #1 and #2.

```

148 \def \MAX#1#2#3{%
149   \ifdim #1pt < #2pt
150     \COPY{#2}{#3}\else\COPY{#1}{#3}\fi\ignorespaces}

```

\MIN \MIN{\#1}{\#2}{\#3} defines the #3 command as the minimum of numbers #1 and #2.

```

151 \def \MIN#1#2#3{%
152   \ifdim #1pt > #2pt
153     \COPY{#2}{#3}\else\COPY{#1}{#3}\fi\ignorespaces}

```

### Real arithmetic

\ABSVALUE \ABSVALUE{\#1}{\#2} defines the #2 command as the absolute value of number #1.

```

154 \def \ABSVALUE#1#2{%
155   \ifdim #1pt<z@
156     \MULTIPLY{-1}{#1}{#2}\else\COPY{#1}{#2}\fi}

```

### Product, sum and difference

\MULTIPLY \MULTIPLY{\#1}{\#2}{\#3} defines the #3 command as the product of numbers #1 and #2.

```

157 \def \MULTIPLY#1#2#3{\cctr@lengtha=#1\p@
158   \cctr@lengtha=#2\cctr@lengtha
159   \edef#3{\expandafter\strip@pt\cctr@lengtha}\ignorespaces}

```

\ADD \ADD{\#1}{\#2}{\#3} defines the #3 command as the sum of numbers #1 and #2.

```

160 \def \ADD#1#2#3{\cctr@lengtha=#1\p@
161   \cctr@lengthb=#2\p@
162   \advance\cctr@lengtha by \cctr@lengthb
163   \edef#3{\expandafter\strip@pt\cctr@lengtha}\ignorespaces}

```

\SUBTRACT \SUBTRACT{\#1}{\#2}{\#3} defines the #3 command as the difference of numbers #1 and #2.

```

164 \def \SUBTRACT#1#2#3{\ADD{#1}{-#2}{#3}}

```

**Divisions** We define several kinds of *divisions*: the quotient of two real numbers, the integer quotient, and the quotient of two lengths. The basic algorithm is a lightly modified version of the Beccari's division.

\DIVIDE \DIVIDE{\#1}{\#2}{\#3} defines the #3 command as the quotient of numbers #1 and #2.

```

165 \def \DIVIDE#1#2#3{%
166   \begingroup

```

Absolute values of dividend and divisor

### Matrix operations

Here, we need to define some internal macros to simulate commands with more than nine arguments.

\@TDMATRIXCOPY This command copies a  $3 \times 3$  matrix to the commands \cctr@solAA, \cctr@solAB, ..., \cctr@solCC.

```

1092 \def\@TDMATRIXCOPY(#1,#2,#3;#4,#5,#6;#7,#8,#9){%
1093     \COPY{#1}{\cctr@solAA}
1094     \COPY{#2}{\cctr@solAB}
1095     \COPY{#3}{\cctr@solAC}
1096     \COPY{#4}{\cctr@solBA}
1097     \COPY{#5}{\cctr@solBB}
1098     \COPY{#6}{\cctr@solBC}
1099     \COPY{#7}{\cctr@solCA}
1100     \COPY{#8}{\cctr@solCB}
1101     \COPY{#9}{\cctr@solCC}}

```

\@TDMATRIXSOL This command copies the commands \cctr@solAA, \cctr@solAB, ..., \cctr@solCC to a  $3 \times 3$  matrix. This macro is used to store the results of a matrix operation.

```
1102 \def\@TDMATRIXSOL(#1,#2,#3;#4,#5,#6;#7,#8,#9){%
```

```

1103      \COPY{\cctr@solAA}{#1}
1104      \COPY{\cctr@solAB}{#2}
1105      \COPY{\cctr@solAC}{#3}

1540       the \noexpand\ensurevectorfunction command does not redefine it}}}

```

## 14.2 New functions

### New scalar functions

`\newfunction` The `\newfunction{#1}{#2}` instruction defines a new function called #1. #2 is the list of instructions to calculate the function \y and his derivative \Dy from the \t variable.

```

1541 \def\newfunction#1#2{%
1542   \ifx #1\undefined
1543     \ccls@deffunction{#1}{#2}

```

```

1544     \else
1545         \ccls@ErrorFuncDef{#1}
1546     \fi}

```

\renewfunction \renewfunction redefines #1, as a new function, if this command is already defined.

```

1547 \def\renewfunction#1#2{%
1548     \ifx #1\undefined
1549         \ccls@ErrorFuncUnDef{#1}
1550     \else
1551         \ccls@deffunction{#1}{#2}
1552     \fi}

```

\ensurefunction \ensurefunction defines the new function #1 (only if this macro is undefined).

```

1553 \def\ensurefunction#1#2{%
1554     \ifx #1\undefined\ccls@deffunction{#1}{#2}
1555     \else
1556         \ccls@InfoFuncEns{#1}
1557     \fi}

```

\forcefunction \forcefunction defines (if undefined) or redefines (if defined) the new function #1.

```

1558 \def\forcefunction#1#2{%
1559     \ccls@deffunction{#1}{#2}}

```

\ccls@deffunction The private \ccls@deffunction command makes the real work. The new functions will have three arguments: ##1, a number, ##2, the value of the new function in that number, and ##3, the derivative.

```

1560 \def\ccls@deffunction#1#2{%
1561     \def#1##1##2##3{%
1562         \begingroup
1563             \def\t{##1}%
1564             #2
1565             \xdef##2{\y}%
1566             \xdef##3{\Dy}%
1567         \endgroup\ignorespaces}

```

### New polar functions

\newpolarfunction The \newpolarfunction{#1}{#2} instruction defines a new polar function called #1. #2 is the list of instructions to calculate the radius \r and his derivative \Dr from the \t arc variable.

```

1568 \def\newpolarfunction#1#2{%
1569     \ifx #1\undefined
1570         \ccls@defpolarfunction{#1}{#2}
1571     \else
1572         \ccls@ErrorPFuncDef{#1}
1573     \fi}

```

\renewpolarfunction \renewpolarfunction redefines #1 if already defined.

```

1574 \def\renewpolarfunction#1#2{%
1575     \ifx #1\undefined

```

```

1576           \ccls@ErrorPFuncUnDef{#1}
1577     \else
1578       \ccls@defpolarfunction{#1}{#2}
1579   \fi}

\ensurepolarfunction \ensurepolarfunction defines (only if undefined) #1.
1580 \def\ensurepolarfunction#1#2{%
1581   \ifx #1\undefined\ccls@defpolarfunction{#1}{#2}
1582   \else
1583     \ccls@InfoPFuncEns{#1}
1584   \fi}

\forcepolarfunction \forcepolarfunction defines (if undefined) or redefines (if defined) #1.
1585 \def\forcepolarfunction#1#2{%
1586   \ccls@defpolarfunction{#1}{#2} }

\ccls@defpolarfunction The private \ccls@defpolarfunction command makes the real work. The new functions will have three arguments: ##1, a number (the polar radius), ##2, ##3, ##4, and ##5, the x and y component functions and its derivatives at ##1.
1587 \def\ccls@defpolarfunction#1#2{%

### New vector functions

```

\newvectorfunction The \newvectorfunction{#1}{#2} instruction defines a new vector (parametric) function called #1. #2 is the list of instructions to calculate \x, \y, \Dt and \Dy from the \t arc variable.
1605 \def\newvectorfunction#1#2{%
1606   \ifx #1\undefined
1607     \ccls@defvectorfunction{#1}{#2}
1608   \else
1609     \ccls@ErrorVFuncDef{#1}
1610   \fi}

```

```

\renewvectorfunction \renewvectorfunction redefines #1 if already defined.
1611 \def\renewvectorfunction#1#2{%
1612     \ifx #1\undefined
1613         \ccls@ErrorVFuncUnDef{#1}
1614     \else
1615         \ccls@defvectorfunction{#1}{#2}
1616     \fi}

\ensurevectorfunction \ensurevectorfunction defines (only if undefined) #1.
1617 \def\ensurevectorfunction#1#2{%
1618     \ifx #1\undefined\ccls@defvectorfunction{#1}{#2}
1619     \else
1620         \ccls@InfoVFuncEns{#1}
1621     \fi}

\forcevectorfunction \forcevectorfunction defines (if undefined) or redefines (if defined) #1.
1622 \def\forcevectorfunction#1#2{%
1623     \ccls@defvectorfunction{#1}{#2} }

\ccls@defvectorfunction The private \ccls@defvectorfunction command makes the real work. The new functions will have three arguments: ##1, a number, ##2, ##3, ##4, and ##5, the x and y component functions and its derivatives at ##1.

## 14.3 Polynomials

### Linear (first degreeee) polynomials

```

\newlpoly The \newlpoly{#1}{#2}{#3} instruction defines the linear polynomial
#1 = #2 + #3t.
1634 \def\newlpoly#1#2#3{%
1635     \newfunction{#1}{%
1636         \ccls@lpoly{#2}{#3}}}

```

\renewlpoly We define also the \renewlpoly, \ensurelpoly and \forcelpoly variants.

```

1637 \def\renewlpoly#1#2#3{%
1638     \renewfunction{#1}{%
1639         \ccls@lpoly{#2}{#3}}}

```

```

\ensurelpoly
1640 \def\ensurelpoly#1#2#3{%
1641     \ensurefunction{#1}{%
1642         \ccls@lpoly{#2}{#3}}}

\forcepoly
1643 \def\forcepoly#1#2#3{%
1644     \forcefunction{#1}{%
1645         \ccls@lpoly{#2}{#3}}}

\ccls@lpoly The \ccls@lpoly{#1}{#2} macro defines the new polynomial function.
1646 \def\ccls@lpoly#1#2{%
1647     \MULTIPLY{#2}{\t}{\y}%
1648     \ADD{\y}{#1}{\y}%
1649     \COPY{#2}{\Dy}}

```

### Quadratic polynomials

```

\newqpoly The \newqpoly{#1}{#2}{#3}{#4} instruction defines the quadratic polynomial
#1 = #2 + #3t + #4t2.
1650 \def\newqpoly#1#2#3#4{%
1651     \newfunction{#1}{%
1652         \ccls@qpoly{#2}{#3}{#4}}}
