Abstract

This package provides facilities for hard-wrapping text to a certain number of characters per line. The primary purpose is to make it easier for package authors to write readable informational messages to the console and log file; wrappers around \PackageWarning et al. are provided for this.

Part I USER DOCUMENTATION

§1 Introduction

The hardwrap package provides a macro for word-wrapping text to a certain number of characters per line. In addition, helper macros are available for package and document class authors to use in automatically wrapping informational, warning, and error messages. This package requires ε-TEX.

§2 Wrapping text

The main function provided by this package is the `\HardWrap` command, which takes five arguments.

```
\HardWrap {<function>} {<width>} {<setup code>} {<newline>} {<text>}
```

This command will wrap `<text>` to a text block of `<width>` characters wide, inserting `<newline>` at the end of each line and processing the result with `<function>`. The `<text>` is fully expanded before being hard-wrapped; while doing so, the `<setup code>` may be used to change local command definitions.

Inside `<text>`, you may use `\\"` to force a new line and `_` to insert a space. A literal `^J` will also be treated as a forced `<newline>`.

Examples will be given in [section 5](#).

§3 Wrapping log messages

A common use case for the `\HardWrap` macro is to format the informational, warning, and error messages that are printed to the terminal and log file. In support of this, we've provided a simple interface for package and document class authors to do this.

```
\GenerateLogMacros{package}[<prefix>]{<package name>}  
\GenerateLogMacros{class} [<prefix>]{<class name>}
```

If the optional argument `<prefix>` is not given, it is set equal to `<package name>`. These two commands will generate the following macros:

```
\<prefix>@info{<info>}  
\<prefix>@info@noline{<info>}  
\<prefix>@warning{<warning>}  
\<prefix>@warning@noline{<warning>}  
\<prefix>@error{<error>}{<help>}
```

For instance, calling `\GenerateLogMacros{package}{mypackage}` will create macros called `\mypackage@info`, `\mypackage@warning`, etc., which internally use `\PackageInfo`, `\PackageWarning`, and so on, to handle their respective messages. The arguments for the generated macros are the same as the arguments for `\PackageInfo{<package name>}`, `\PackageWarning{<package name>}`, etc. Additionally, info messages may be printed with `\<prefix>@info@noline` in which L^AT_EX's 'on input line `<num>`' suffix is suppressed.

The `\GenerateLogMacros{class}` command instead generates analogous macros using `\ClassInfo{<class name>}`, `\ClassWarning{<class name>}`, etc.

Note that no punctuation is added after messages, unlike standard L^AT_EX. You are free to punctuate your messages as you wish.

As with the `\HardWrap` command, `_` and `\\"` are defined locally inside these messages to mean, respectively, `<space>` and `<newline>`.

Additional redefinitions are stored in the macro `\HardWrapSetup`, which may be altered before executing `\GenerateLogMacro` to change the behaviour of the generated commands. By default, `\HardWrapSetup` is defined as

```
\def\HardWrapSetup{%
  \def\MessageBreak{\\"}%
  \def\newline{\\"}%
  \def\emph##1{\string_##1\string_}%
  \def\textit##1{/##1/}%
  \def\textbf##1{*##1*}%
}
```

The redefinitions for `\emph`, `\textit`, and `\textbf` are examples of the type of customisation you might like to perform.

§4 Changing the line lengths

While `hardwrap` attempts to determine the maximum line lengths based on where T_EX will wrap its console and log output, you may wish to override the value found using `\setmaxprintline{<value>}`. This macro takes an integer value which is subsequently used by the commands generated with `\GenerateLogMacros` as the maximum line width allowed in the terminal output and log file. By default this value is 79.

§5 Examples

The command

```
\HardWrap{\PackageWarning{foobar}}{50}{\HardWrapSetup}{\MessageBreak}{%
  Sed feugiat. Cum sociis natoque...;}
```

produces the following in the console output:

```
Package foobar Warning: Sed feugiat. Cum sociis natoque penatibus et magnis
(foobar)           dis parturient montes, nascetur ridiculus mus. Ut
(foobar)           pellentesque augue sed urna. Vestibulum diam eros,
(foobar)           fringilla et, consectetur eu, nonummy id, sapien.
(foobar)           Nullam at lectus. In sagittis ultrices mauris.
(foobar)           Curabitur malesuada erat sit amet massa. Fusce
(foobar)           blandit. Aliquam erat volutpat. Aliquam euismod.
(foobar)           Aenean vel lectus. Nunc imperdiet justo nec
(foobar)           dolor; on input line 102.
```

Compare this to the following without the manual wrapping; TeX breaks lines at 79 characters without keeping words together (e.g., ‘Vestibulum’ broken between lines two and three):

```
Package foobar Warning: Sed feugiat. Cum sociis natoque penatibus et magnis dis
parturient montes, nascetur ridiculus mus. Ut pellentesque augue sed urna. Ves
tibulum diam eros, fringilla et, consectetur eu, nonummy id, sapien. Nullam at
lectus. In sagittis ultrices mauris. Curabitur malesuada erat sit amet massa.
Fusce blandit. Aliquam erat volutpat. Aliquam euismod. Aenean vel lectus. Nunc
imperdiet justo nec dolor; on input line 110.
```

The `\HardWrap` macro can also be useful when writing to an external file. For example, one may use:

```
\newwrite\textfile
\immediate\openout\textfile=\jobname.txt\relax
\HardWrap{\immediate\write\textfile}{50}{\HardWrapSetup}{^J}{%
  Sed feugiat. Cum sociis natoque...;}
\closeout\textfile
```

to write the text to a file after being hard-wrapped with carriage returns (^J) after each line.

§6 Support

Development and historical versions are available from GitHub at <http://github.com/wspr/hardwrap/>.

Please report bugs and feature suggestions to the issue tracker at <http://github.com/wspr/hardwrap/issues>.

Part II IMPLEMENTATION

Read on if you're curious what's behind the curtain.

`1 <*package>`

S7 Preliminaries

```
2 \IfFileExists{ifplatform.sty}{%
3   \RequirePackage{ifplatform}
4 }{%
5   \newif\ifwindows
6   \IfFileExists{/dev/null}{\windowsfalse}{\windowstrue}
7 }
8 \IfFileExists{pdftexcmds.sty}{%
9   \RequirePackage{pdftexcmds}
10 }{%
11   \def\pdf@shellescape{\pdfshellescape}
12 }
13 \RequirePackage{ifxetex}
14 \hw@charcount, \hw@wordcount
```

These counters hold, respectively, the number of characters on the current line and the number of characters in the current word.

```
14 \newcount\hw@charcount
15 \newcount\hw@wordcount
16 \hw@currtext, \hw@currlne, \hw@currword
```

The following are local variables to store the current contents of the wrapped text, line, and word.

```
16 \def\hw@currtext{}
17 \def\hw@currlne{}
18 \def\hw@currword{}
```

`\hw@protected@newline` (cont.)

This macro is called each time a line break is created. It typically holds `\MessageBreak` for log messages, but could be set to `\\"` for typeset text.

`19 \protected\def\hw@protected@newline{}`

`\hw@protected@space, \hw@expanding@space`

The `\hw@protected@space` definition of ‘space’ is designed to be switched for a real space later on using `\hw@expanding@space`, which is also inserted into scratch variables as the ‘real’ space char.

`20 \protected\def\hw@protected@space{ }`

`21 \let\hw@expanding@space\space`

`\hw@insert@newline`

This is a placeholder to show where manual newlines are inserted. (It will never be executed.)

`22 \protected\def\hw@insert@newline{\hw@insert@newline}`

`\hw@scanstop`

This is a ‘quark’ from `expl3` designed to delimit scanning; it will never be executed, else an infinite loop results.

`23 \protected\def\hw@scanstop{\hw@scanstop}`

§8 Utility macros

`\hw@strlen, \hw@strlen@of`

A simple string-length macro. `\hw@strlen{<token list>}` is the number of tokens (or brace groups) of its `<token list>` argument without expansion.

`24 \def\hw@strlen#1{%`
`25 \numexpr0\hw@Ncharscan#1\hw@scanstop\relax`
`26 }`
`27 \def\hw@Ncharscan#1{%`
`28 \ifx#1\hw@scanstop`
`29 \expandafter@gobble`
`30 \else`
`31 \expandafter\@firstofone`
`32 \fi`
`33 {+1\hw@Ncharscan}%`
`34 }`

`\hw@strlen`, etc. (cont.)

Variant `\hw@strlen@of<macro>` is the number of tokens (or brace groups) of the contents of its `<macro>` argument.

```
35 \def\hw@strlen@of#1{%
36   \expandafter\hw@strlen\expandafter{#1}%
37 }
```

`\hw@maxprintline`

Some code to detect \TeX 's `max_print_line` value. This only works for $\text{pdf}\text{\TeX}$ in \TeX Live .

```
38 \newcount\hw@maxprintline
39 \ifluatex\else
40   \ifxetex\else
41     \ifwindows\else
42       \ifnum\pdf@shellescape>0\relax
43         \hw@maxprintline=\@@input"|\kpsewhich -var-value=max_print_line"\relax
44       \fi
45     \fi
46   \fi
47 \fi
```

In the non-unlikely chance the correct value cannot be determined, the usual default is assumed. This value will rarely, if ever, be different to the default, so assuming this number is very safe.

```
48 \ifnum\hw@maxprintline=0\relax
49   \hw@maxprintline=79\relax % default
50 \fi
```

`\setmaxprintline`

In case the code above borks the `\hw@maxprintline` value, the user can set it manually with the `\setmaxprintline` macro.

```
51 \newcommand*{\setmaxprintline}[1]{%
52   \hw@maxprintline=#1\relax
53 }
```

§9 Main procedure

The idea for hard-wrapping the text is to assume we can fully expand the argument and then iterate character-by-character over the message inserting `\newline` commands where appropriate. The steps are:

1. Make local redefinitions for general commands, including special placeholders for $\langle space \rangle$ and $\langle newline \rangle$.
2. Fully expand the text-to-be-wrapped with appropriate definitions of `\protect` and `\noexpand` so the resultant text can be assumed to completely ‘safe’ to scan over (and continue expanding) but *without* removing important macro placeholders for $\langle space \rangle$ and $\langle newline \rangle$.
3. Then scan character by character. Whenever a space is found, check the last word length and either append the word to the current line if it will fit, or start a new line with a forced line break represented by another special placeholder macro. Spaces are represented with placeholders so multiple spaces don’t collapse according to TeX’s usual space-handling rules.
4. Finally process the wrapped text with appropriate meanings for the placeholder macros.

`\HardWrap`

Here’s the main command that implements the steps outlined above. Arguments:

1. $\{ \langle function \rangle \}$
2. $\{ \langle chars\ to\ wrap\ to \rangle \}$
3. $\{ \langle setup \rangle \}$
4. $\{ \langle newline \rangle \}$
5. $\{ \langle text \rangle \}$

This is the macro that does everything. Note that the `\space` is first made ‘protected’ and then restored again.

```
54 \newcommand*{\HardWrap}[5]{%
55   \begingroup
56     \hw@maxprintline=\numexpr#2\relax
```

Replacements for user commands:

```
57   \let\space\hw@protected@space
58   \def\ {\space}%
59   \let\\hw@insert@newline
```

To avoid problems with repeated `\edef` with arbitrary csnames:

```
60   \let\noexpand\string
```

\HardWrap (*cont.*)

Execute the custom setup, and then fully expand the text to be wrapped, turning \protected macros into strings. (Fully \protected macros will still be actual control sequences at this point.)

```
61   \begingroup
62     #3%
63     \let\protect\string
64     \xdef\@tempa{#5}%
65   \endgroup
```

Now scan over the text token by token, transforming it into an intermediate representation of fully wrapped text. Then fully expand this intermediate form into its final form, ready to be processed by the input function #1.

```
66   \expandafter\hw@scan\@tempa\hw@scanstop
67   \def\\{\hw@protected@newline}%
68   \def\hw@protected@newline{#4}%
69   \let\space\hw@expanding@space
70   \@temptokena={#1}%
71   \expandafter\the\expandafter\@temptokena\expandafter{\hw@wrappedtext}%
72 \endgroup
73 }
```

\hw@scan

Convenience wrapper for \futurelet.

```
74 \def\hw@scan{%
75   \futurelet\let@token\hw@process
76 }
```

\hw@process

The \hw@process macro contains the actual word-wrapping algorithm. The text is scanned token by token. Each token falls into one of five categories: (1) the stop token \hw@scanstop, (2) a space token, (3) a newline insertion, (4) an opening brace, or (5) anything else.

1. If we encounter the \hw@scanstop token, then we've hit the end of the string. Swallow the stop token and stop processing.
2. If we find a space, add the word to the current line if it fits, otherwise insert a line break and put the word on its own line. Continue reading tokens.

\hw@process (*cont.*)

3. If we find an explicit ‘newline’, we process it much as if it were a space and the current word is the last one that can fit on the line. To continue, skip the actual token that is the ‘newline’ and then start scanning again.
4. If we find an opening brace {, we read in the entire brace group, and then re-insert it in the scanner surrounded with brace-strings. I.e., braces are printed in the output.
5. If the token doesn’t fall into one of the above special cases, we’ll just append it to the current word and continue reading tokens.

```
77 \def\hw@process{%
78   \ifx\let@token\hw@scanstop\relax
79     \hw@process@end
80     \let\next@gobble
81   \else\ifx\let@token@sptoken
82     \hw@process@space
83     \def\next{\afterassignment\hw@scan\let@\tempa= }%
84   \else\ifx\let@token\hw@insert@newline
85     \hw@process@messagebreak
86     \def\next{\expandafter\hw@scan@gobble}%
87   \else\ifx\let@token^J
88     \hw@process@messagebreak
89     \def\next{\expandafter\hw@scan@gobble}%
90   \else\ifx\let@token\bgroup
91     \def\next{\expandafter\hw@dochar\hw@process@group}%
92   \else
93     \let\next\hw@dochar
94   \fi\fi\fi\fi\fi
95   \next
96 }
```

\hw@dochar

After a letter, the \hw@dochar macro just appends a token (non-space and non-stop token) to the current word.

```
97 \def\hw@dochar#1{%
98   \edef\hw@currword{\hw@currword #1}%
99   \hw@scan
100 }
```

```

\hw@process@space

101 \def\hw@process@space{%
102   \hw@wordcount=\hw@strlen@of\hw@currword\relax
103   \ifnum\numexpr(\hw@charcount+\hw@wordcount)\relax<\hw@maxprintline
104     \advance\hw@charcount by \hw@wordcount
105     \ifx\hw@currline\@empty
106       \edef\hw@currline{\hw@currword}%
107     \else
108       \advance\hw@charcount by 1\relax % account for the space character
109       \edef\hw@currline{\hw@currline\hw@expanding@space\hw@currword}%
110     \fi
111   \else
112     \hw@charcount=\hw@wordcount\relax
113     \edef\hw@currtext{\hw@currtext\hw@currline\hw@protected@newline}%
114     \let\hw@currline\hw@currword
115   \fi
116   \let\hw@currword\@empty
117 }

\hw@process@messagebreak

118 \def\hw@process@messagebreak{%
119   \hw@wordcount=\hw@strlen@of\hw@currword\relax
120   \ifnum\numexpr(\hw@charcount+\hw@wordcount)<\hw@maxprintline
121     \edef\hw@currtext{%
122       \hw@currtext
123       \ifx\hw@currline\@empty\else
124         \hw@currline\space
125       \fi
126       \hw@currword\hw@protected@newline
127     }%
128     \hw@charcount=0\relax
129     \let\hw@currline\@empty
130   \else
131     \edef\hw@currtext{\hw@currtext\hw@currline\hw@protected@newline}%
132     \hw@charcount=\hw@wordcount
133     \let\hw@currline\hw@currword
134   \fi
135   \let\hw@currword\@empty
136 }

```

\hw@process@end

The final stage of processing the text. We've just come to the end of the final word on the final line: add the word to the current line if it fits, otherwise insert a line break and put the word on its own line.

```
137 \def\hw@process@end{%
138   \hw@wordcount=\hw@strlen@of\hw@currword\relax
139   \ifnum\numexpr(\hw@charcount+\hw@wordcount)<\hw@maxprintline
140     \edef\hw@wrappedtext{%
141       \hw@currtext
142       \ifx\hw@currline\@empty\else
143         \hw@currline\space
144       \fi
145       \hw@currword
146     }%
147   \else
148     \edef\hw@wrappedtext{%
149       \hw@currtext\hw@currline\hw@protected@newline\hw@currword
150     }%
151   \fi
152 }
```

\hw@process@group

If a brace group is found, we read it as an argument and then surround it with brace strings (i.e., braces are printed).

```
153 \edef\hw@process@group#1{%
154   \expandafter@gobble\string\{%
155   #1%
156   \expandafter@gobble\string\}%
157 }
```

\HardWrapSetup

This is the command to use if you want to ‘special-case’ some meanings to be more appropriate inside message text. When using \GenerateLogMacros, it is used by default for argument #3 in \HardWrap.

```
158 \def\HardWrapSetup{%
159   \def\MessageBreak{\\"}%
160   \def\newline{\\"}%
161   \def\emph##1{\string_##1\string_}%
162   \def\textit##1{/##1/}%
163   \def\textbf##1{*##1*}%
```

\HardWrapSetup (cont.)

¹⁶⁴ }

§10 Wrapping log messages

LATEX informational, warning, and error messages are printed in the format:

Package $\langle\text{pkgname}\rangle$ Info: This is an informational message.
 $\langle\text{pkgname}\rangle$ That spans multiple lines. The
 $\langle\text{pkgname}\rangle$ \MessageBreak macro is used to split
 $\langle\text{pkgname}\rangle$ the text across lines.
←—————A—————→ ←—————B—————→
—————max_print_line—————→

The maximum line length (*max_print_line*) is used by TeX for all log file and terminal output. It defaults to 79 characters but may be changed by editing the *texmf.cnf* file.

The length of *A* is the sum of three values:

1. whether it's a class or package message: add 6 for class messages, and 8 for package messages;
2. the length of the package name;
3. the type of message: information (add 7), warning (add 10), or error (add 10).

The length of *B* is the difference between *max_print_line* and *A* plus one for the extra space between them. Note that the length of *B* for the warning and error text is the same.

\hw@suffix

This string is used as a suffix to LATEX warnings and info messages to push the automatic 'on input line *<num>*' onto the next line. This makes writing grammatically correct messages somewhat easier.

¹⁶⁵ \newcommand{\hw@suffix}{^^\JThis message occurred}

\GenerateLogMacros

Shortcuts are provided for generating logging macros that automatically wrap the text provided to them. The \GeneratePackageLogMacros and \GenerateClassLogMacros calculate the various lengths of *B* appropriately.

```

\GenerateLogMacros (cont.)

166 \newcommand{\GenerateLogMacros}[1]{%
167   \lowercase{\def\hw@tempa{#1}}%
168   \def\hw@tempb{package}%
169   \ifx\hw@tempa\hw@tempb
170     \expandafter\GeneratePackageLogMacros
171   \else
172     \def\hw@tempb{class}%
173     \ifx\hw@tempa\hw@tempb
174       \expandafter\expandafter\expandafter\GenerateClassLogMacros
175     \else
176       \PackageError{hardwrap}{\MessageBreak
177         \string\GenerateLogMacros\space only accepts "package"
178         \MessageBreak or "class" types%
179       }%
180       E.g., \detokenize{\GenerateLogMacros{package}[HW]{hardwrap}}%
181     }%
182   \fi
183 \fi
184 }

\GeneratePackageLogMacros, \GenerateClassLogMacros

185 \newcommand{\GeneratePackageLogMacros}[2][]{%
186   \hw@generate@logging@macros{package}{#1}{#2}%
187   {\hw@maxprintline-\hw@strlen{#2}-16}%
188   {\hw@maxprintline-\hw@strlen{#2}-19}%
189 }
190 \newcommand{\GenerateClassLogMacros}[2][]{%
191   \hw@generate@logging@macros{class}{#1}{#2}%
192   {\hw@maxprintline-\hw@strlen{#2}-14}%
193   {\hw@maxprintline-\hw@strlen{#2}-17}%
194 }

\hw@generate@logging@macros

```

And now for the code that generates all the logging macros. Arguments:

1. {*'package'* or *'class'*}
2. {*<prefix>*}
3. {*<package name>*}
4. {*<info message length>*}
5. {*<warning message length>*}

\hw@generate@logging@macros (cont.)

The $\langle info \dots \rangle$ and $\langle warning\ message\ length \rangle$ values correspond to the calculation of B as described above.

First of all, if the $\langle prefix \rangle$ is not specified then fall back to the $\langle package\ name \rangle$:

```
195 \newcommand{\hw@generate@logging@macros}[5]{%
196   \def\@tempa{#2}\ifx\@tempa\@empty
197     \hw@generate@logging@macros@aux{#1}{#3}{#3}{#4}{#5}%
198   \else
199     \hw@generate@logging@macros@aux{#1}{#2}{#3}{#4}{#5}%
200   \fi
201 }
```

Finally, the main procedure. Info messages first:

```
202 \newcommand{\hw@generate@logging@macros@aux}[5]{%
203   \expandafter\edef\csname #2@info\endcsname##1{%
204     \noexpand\HardWrap
205     {\@nameuse{\hw@#1@info}{#3}}
206     {\number\numexpr#4\relax}
207     {\unexpanded\expandafter{\HardWrapSetup}}
208     {\noexpand\MessageBreak}
209     {##1}%
210   }%
211   \expandafter\edef\csname #2@info@noline\endcsname##1{%
212     \noexpand\HardWrap
213     {\@nameuse{\hw@#1@info@noline}{#3}}
214     {\number\numexpr#4\relax}
215     {\unexpanded\expandafter{\HardWrapSetup}}
216     {\noexpand\MessageBreak}
217     {##1}%
218   }%
```

Now warnings:

```
219 \expandafter\edef\csname #2@warning\endcsname##1{%
220   \noexpand\HardWrap
221   {\@nameuse{\hw@#1@warning}{#3}}
222   {\number\numexpr#5\relax}
223   {\unexpanded\expandafter{\HardWrapSetup}}
224   {\noexpand\MessageBreak}
225   {##1}%
226 }%
227 \expandafter\edef\csname #2@warning@noline\endcsname##1{%
228   \noexpand\HardWrap
```

```
\hw@generate@logging@macros (cont.)
```

```
229      {\@nameuse{hw@#1@warning@noline}{#3}}  
230      {\number\numexpr#5\relax}  
231      {\unexpanded\expandafter{\HardWrapSetup}}  
232      {\noexpand\MessageBreak}  
233      {##1}%  
234  }%
```

And finally errors.

In addition to the *<info>* and *<warning>* lengths, the \PackageError macro allows for additional text to be displayed when the user requests it. This text doesn't have anything prepended to each line, so the length of this text is the same as *max_print_line*.

```
235  \expandafter\edef\csname #2@error\endcsname##1##2{  
236      \noexpand\HardWrap  
237      {\xdef\noexpand\hw@tempa}  
238      {\number\numexpr#5\relax}  
239      {\unexpanded\expandafter{\HardWrapSetup}}  
240      {\MessageBreak}  
241      {\MessageBreak ##1}%  
242      \noexpand\HardWrap  
243      {\xdef\noexpand\hw@tempb}  
244      {\the\hw@maxprintline}  
245      {\unexpanded\expandafter{\HardWrapSetup}}  
246      {\MessageBreak}  
247      {\MessageBreak ##2}%  
248      \unexpanded{  
249          \@nameuse{hw@#1@error}{#3}{\hw@tempa}{\hw@tempb}%  
250      }%  
251  }%  
252 }
```

Here are our wrappers for \ClassInfo et al., which are used above to generalise the code a little. Note that these macros are \protected, which allows them to be used in an expanding context without a preceding \noexpand.

```
253 \protected\def\hw@class@info      #1#2{\ClassInfo  {#1}{#2\hw@suffix}}  
254 \protected\def\hw@class@info@noline #1#2{\ClassInfo  {#1}{#2@gobbletwo}}  
255 \protected\def\hw@class@warning   #1#2{\ClassWarning{#1}{#2\hw@suffix}}  
256 \protected\def\hw@class@warning@noline#1#2{\ClassWarning{#1}{#2@gobbletwo}}  
257 \protected\def\hw@class@error    #1#2{\ClassError  {#1}{#2@gobble}}
```

And package messages:

```

\hw@generate@logging@macros (cont.)

258 \protected\def\hw@package@info          #1#2{\PackageInfo  {#1}{#2\hw@suffix}}
259 \protected\def\hw@package@info@noline   #1#2{\PackageInfo  {#1}{#2@gobbletwo}}
260 \protected\def\hw@package@warning       #1#2{\PackageWarning{#1}{#2\hw@suffix}}
261 \protected\def\hw@package@warning@noline#1#2{\PackageWarning{#1}{#2@gobbletwo}}
262 \protected\def\hw@package@error        #1#2{\PackageError  {#1}{#2@gobble}}
263 </ package>

```

Part III TEST SUITE
