

The `longfigure` Package*

Tim Arnold[†]

Released 2014/01/06

1 Usage

The `longfigure` package uses and relabels components of the well-known `longtable` package, written by David Carlisle, to provide a table-like environment that can display a stream of subfigures as a single figure that can break across pages.

The `longtable` package defines a `longtable` environment, which produces tables that can be broken by TeX's standard page-breaking algorithm. Similarly, the `longfigure` package defines a `longfigure` environment, which produces figures that can be broken by TeX's standard page-breaking algorithm. The internal structure of a long figure is similar to a long table. Rows might contain (for example) tables or graphics. Page breaks can occur only between rows.

The `longfigure` package differs from the `longtable` package in the following ways:

- The `longfigure` package supports two additional key-value options:
 - The `fignum=` option specifies the counter for numbering `longfigure` environments. You can specify any string; the default is `figure`. When you specify a `fignum=` value for which no counter already exists, the `longfigure` package loads the `tocloft` package and creates the counter.
 - The `resetby=` option specifies a counter (for example, `resetby=chapter`) such that output numbering is reset each time the counter value changes. If a counter is specified that does not exist, the `tocloft` package is loaded to create the new counter. For information about how the lists are typeset, see the `tocloft` package documentation.
- The counters and macros that start with `\LT` in the `longtable` package are renamed to start with `\LF` in the `longfigure` pacakge to avoid namespace conflicts when the two packages are used together. The generic macros that are defined in the `longtable` package (`\endfirsthead`, `\endhead`,

*This file describes version v1.0, last revised 2014/01/06.

[†]E-mail: tim.arnold@sas.com

\endfoot, and \endlastfoot) are also renamed with \LF as a prefix in the `longfigure` package.

- The `\LF@name` macro is based on the `\fnum@table` macro from the `longtable` package. The `\LF@name` macro returns the capitalized counter name and value. For example, if the counter is `figure` and the macro is processing the second `longfigure`, the `\LF@name` macro would contain the value “Figure 2.”

You can use the `longfigure` package defaults to produce a *List of Figures* by inserting the following tag in your document at the point where you want the list to appear:

```
\listoffigures
```

The default counter used to display figures is the `figure` counter, but you can specify a different counter. For example, if you want your figures to be labeled as “Display,” specify `fignum=display` when you load the `longfigure` package; to display a *List of Displays*, insert the following command in your document at the point where you want the list to appear:

```
\listofdisplay
```

Note: If you specify a counter that does not exist, an auxiliary file with extension `.lft` is created to contain the information needed to create the list.

If you want to use more advanced features of the `tocloft` package, load it before you load the `longfigure` package so that the `longfigure` package sees that the counters specified by the `fignum=` and `resetby=` options are already defined and does not attempt to create them.

1.1 Example

The following lines produce a single figure that contains three images and one tabular environment. Each element is a row of the `longfigure` environment. Page breaks can occur between rows.

```
\documentclass{book}
\usepackage{graphicx}
\usepackage{longfigure}

\begin{document}
\begin{longfigure}{c}
\caption{My Long Figure}\label{mlfig} \\
\includegraphics[width=3in]{myfig1} \\
\includegraphics[width=3in]{myfig2} \\
\includegraphics[width=3in]{myfig3} \\
\begin{tabular}{ll}
one & two \\
three & four \\
\end{tabular}
\end{longfigure}
```

```
\end{longfigure}
\end{document}
```

In this example, the `{c}` argument in the `\begin{longfigure}` command specifies only a single centered column. You can also specify multiple columns and, if needed, use the `\multicolumn` command for more flexibility.

The following lines display another example that specifies a 'continued' heading when the figure breaks over a page. It also displays a double horizontal line at the end of the figure.

```
\documentclass{book}
\usepackage{graphicx}
\usepackage{longfigure}

\begin{document}
\begin{longfigure}{c}
\caption{My Long Figure}\label{mlfig2} \\
\hline\endLFfirsthead
\caption{continued}\ \\
\hline\endLFhead
\hline\endLFfoot
\hline\hline\endLFlastfoot
\includegraphics[width=3in]{myfig1} \\
\includegraphics[width=3in]{myfig2} \\
\includegraphics[width=3in]{myfig3} \\
\begin{tabular}{ll}
one & two \\
three & four\\
\end{tabular}
\end{longfigure}
\end{document}
```

2 Implementation

This section describes the implementation of the `longfigure` package. The comments describe only the changes from the `longtable` package code. For complete details about the logic and usage of the `longtable` environment, see Carlisle (2004).

1 `\ProvidesPackage{longfigure}[2014/01/06 longfigure]`

The following statement loads the `xkeyval` package for declaring and processing package options:

2 `\RequirePackage{xkeyval}`

The following statement defines a new command, `\LFcounter`, to contain the string `figure`. Later code tests whether a counter with that name exists.

3 `\newcommand*{\LFcounter}{figure}`

The following statement defines a new command, `\LFreset`, to contain the name of the counter within which the `longfigure` number should reset. If no value is specified, the long figures are numbered consecutively through the document.

```
4 \newcommand*\{\LFreset\}{\emptyset}
```

2.1 Options

The `\LFcounter` and `\LFreset` commands support the package options `figname=` and `resetby=` as follows:

```
5 \DeclareOptionX{figname}[figure]{\renewcommand*\{\LFcounter\}{#1}}
6 \DeclareOptionX{resetby}{\renewcommand*\{\LFreset\}{#1}}
```

The following statements further define the options that the `longtable` package defines:

```
7 \DeclareOptionX{set}={}
8 \DeclareOptionX{final}={}
9 \DeclareOptionX{errorshow}{\def\LF@warn{\PackageInfo{longfigure}}}
10 \DeclareOptionX{pausing}{\def\LF@warn#1{\LF@err{#1}{This is not really an error}}}
11 \ProcessOptionsX
```

The following statements process the options:

```
12 \def\LFProcessOptions#1{
13   \@ifundefined{c@#1}{%
14     \RequirePackage{tocloft}
15     \def\LFuc##1##2{\MakeUppercase{##1}{##2}}
16     \expandafter\def\csname list#1name\endcsname{List of \LFuc#1s}
17     \ifx\empty\LFreset%
18       \newlistof{#1}{lft}{\csname list#1name\endcsname}
19     \else
20       \newlistof[\LFreset]{#1}{lft}{\csname list#1name\endcsname}
21     \fi
22   }{}%
23 }
24 \expandafter\LFProcessOptions\expandafter{\LFcounter}
```

If a counter is specified that does not exist, its name (`\c@countername`) is undefined and the `longfigure` package loads the `tocloft` package in order to use its commands to create the new counters and list.

Thus, the `tocloft` package is required only when a new counter is specified, and this automatic loading takes place only if the counter that is specified in the package options is not defined.

You can load the `tocloft` package before loading the `longfigure` package and retain all of the flexibility that the `tocloft` package offers. However, you must define the new counters yourself by using the `\newlistof` command in the `tocloft` package, and you must define the new list to use an auxiliary `lft` file where its auxiliary information is written.

2.2 Utilities

`\strcfstr` The following macro, `\strcfstr`, checks whether two strings, which are provided as arguments, are equal (Wilson, 2001). A new boolean `\ifLF@same` contains the result of the test.

```

25 \newif\ifLF@same
26 \newcommand{\strcfstr}[2]{%
27   \LF@samefalse
28   \begingroup\def\2{\#2}
29   \ifx\2\1\endgroup\LF@sametrue
30   \else\endgroup
31   \fi
32 }
```

`\LFupcase` The following macro, `\LFupcase`, uppercases the first letter of a string (Lazarides, 2010):

```

33 \def\LFupcase#1{%
34   \def\x##1##2{%
35     \MakeUppercase{##1}{##2}\x#1%
36 }
```

The following macro, `\LF@name`, creates a string to provide a label and number for an output. Analogous to the `\fnum@table` macro in the `longtable` package, it contains the capitalized version of the counter name and the counter number (for example, Figure~3).

```

37 \def\LF@name{\expandafter\LFupcase%
38           \expandafter{\LFcounter}%
39           \expandafter\csname the\LFcounter\endcsname}
```

The remainder of this package follows the `longtable` package almost identically, except that macros, skips, counters, and so on use an `\LF` prefix instead of the `\LT` prefix that the `longtable` package uses.

```

2.3 Captioning

You can easily change how a long figure is captioned by redefining the `\LF@makecaption` macro after loading the `longfigure` package. The following statements show the default definition of the `\LF@makecaption`:

```

349 \def\LF@caption{%
350   \noalign\bgroup

```

```
351     \@ifnextchar[{\egroup\LF@c@ption\@firstofone}\LF@capti@n}
```

The `\LF@caption` command begins the process. If it includes an optional argument, it calls `\LF@c@ption`; otherwise it calls `\LF@capti@n`, which then calls `\LF@c@ption`.

```
352 \def\LF@c@ption#1[#2]{%
353   \LF@makecaption#1\LF@name{#3}%
354   \def\@tempa{#2}%
355   \ifx\@tempa\empty\else
```

If a list of long figures is requested, the following code uses the previously defined `\strcfstr` macro and `\ifLF@same` boolean to determine the name of the counter and set the output file to contain the `longfigure` information.

The code writes to one of the following files.

- If the counter is `figure`, write to the `lof` file.
- If the counter is `table`, write to the `lot` file.
- Otherwise, write to `lft`, a file created here for this purpose.

```
356   {\let\\space
357    \strcfstr{\LFcounter}{figure}
358      \ifLF@same\def\LFoutfile{lof}\else
359        \strcfstr{\LFcounter}{table}
360          \ifLF@same\def\LFoutfile{lot}\else
361            \def\LFoutfile{lft}\fi\fi
362          \addcontentsline{\LFoutfile}{\LFcounter}
363          {\expandafter\protect\expandafter\numberline\expandafter%
364           \expandafter\csname the\LFcounter\endcsname{#2}}\fi
365       \fi
366 }
```

The `\LF@c@ption` macro ends the process when it calls the `\LF@makecaption` macro, which typesets the caption.

```
367 \def\LF@capti@n{%
368   \@ifstar
369     {\egroup\LF@c@ption\@gobble[]}\%
370     {\egroup\@xdblarg{\LF@c@ption\@firstofone}}}
```

If you want to redefine how the `longfigure` is captioned, you need to override the following macro. The first argument is the name of the counter (for example, `Figure`), the second argument is the number of the counter, and the third argument is the caption itself.

```
371 \def\LF@makecaption#1#2#3{%
372   \LF@mcol\LF@cols c{\hbox to\z@{\hss\parbox[t]\LFcapwidth{%
373     \sbox\@tempboxa{#1#2: }#3}\hsize
374     \ifdim\wd\@tempboxa>\hsize
375       #1#2: }#3\hfil\box\@tempboxa\hfil}}
```

```

378     \fi
379     \endgraf\vskip\baselineskip}%
380   \hss}}}
381 \def\LF@output{%
382   \ifnum\outputpenalty <-\@Mi
383     \ifnum\outputpenalty > -\LF@end@open
