Hello,

this is a template file to show the usage of the tudaletter class.

The most important options can be found within the source file of this document. Other options or layout adjustments may not comply CI regulations and therefore should not be used.

Supported options:

premium=true/false Enable coloring of the headline. Disabled by default.

firstpagenumber=true/false Disable pagenumbering for the first page. Enabled by default.

raggedright=true/false Set all text ragged right. Default setting is false and uses justified text.

logo=true/false Disable logo in the headline for all pages but first one.

texwidth=narrow/wide The design requires the text width to change between the first page and the rest of the letter.

texwidth=narrow/wide This setting is corresponds to the value "wide". I case this change happens within a paragraph the mechanism to do this adjustment is quite complex and might not work in all cases. If you face any other special case it would be great to receive a report, so we can try to improve the used methods.

To reuse the sender's address the template provides an example lco-file. See the KOMA-Script documentation on details about these files and how to use them.

Happy TEXing

Prof. Dr. Max Mustermann
